GLAINTELLIGENCE UNIT

Ward Level Summary Measures of Indices of Deprivation 2010

Intelligence Update 01-2012

Introduction

This Update presents a ward level analysis of the Indices of Deprivation 2010 (ID2010) from the Department for Communities and Local Government (CLG) as they relate to London. These Indices update the Indices of Deprivation 2007 and like them were produced to identify areas of need at a small area level. There are three Indices. The main one is the Index of Multiple Deprivation (IMD), which uses a complex series of statistical procedures to combine information on a range of aspects of deprivation into a single measure. Alongside this are two supplementary indices, which concentrate on the proportion of particular population groups living in low-income households. Measures summarising the IMD at local authority level have been published by CLG, but no information has been published at ward level. A Briefing 'English Indices of Deprivation 2010: A London Perspective' giving further details of the Indices at small area level for London is also published by the Greater London Authority, Intelligence Briefing 2011-06.

This Update presents for all wards in London, summary measures¹ of the small area Indices corresponding to those published by CLG at the Local Authority level, as far as is practicable and appropriate, and additional summary information which may be useful. Ward level and Local Authority level versions of the supplementary indices – Income Deprivation Affecting Children Index and Income Deprivation Affecting Older People Index are published in a separate Intelligence Update 02-2012.

The Indices

The Index of Multiple Deprivation is based on the concept of measuring distinct dimensions of deprivation separately and then combining these to give an overall score. It is an area based measure, rather than an individual based measure, so it measures the extent of each type of deprivation within the area and then combines these to give a figure taking into account the extent of each type of deprivation. It does this by using statistical techniques to combine information on economic and social issues to produce scores for small areas across the whole of England. These are then used to rank the areas according to their relative level of deprivation.

Seven distinct dimensions or 'domains' of deprivation are included in the IMD2010, made up of 37 separate indicators. The domains are:

- Income deprivation
- Employment deprivation
- Health deprivation and disability
- Education, skills and training deprivation
- Barriers to housing and services
- Living environment deprivation
- Crime

¹ Calculated by the Greater London Authority

These seven domains have been produced for each small area, and are then combined to produce a single score for each area in the country. These are then ranked to compare the areas across England. The Indices are based mainly on data relating to 2008, although in some cases data relating to several years has been combined to improve robustness and in other cases the only reliable data at the small area level comes from the 2001 Census.

Geography

The purpose of the Indices is to measure multiple deprivation, or identify areas of need, at the small area level, so each of the three indices is produced for small areas known as Lower Layer Super Output Areas (LSOAs). These are geographical areas devised, following the 2001 Census of Population, to be of a consistent size, generated in a consistent way across the whole of England. Each area had a total population size of around 1,500 people. These areas are nested, as far as possible, within electoral wards (as they existed in 2002). There are exceptions to this, such as in the City of London, where ward populations are so small that this is not possible. The LSOAs were created to be "fixed" geographical zones used for statistical purposes. Thus population sizes of LSOAs are likely to have greater variation over time.

LSOAs therefore have advantages over wards for identifying areas of need in that they are of a more consistent population size across the country and they are generally smaller than wards, particularly in urban areas. While it would be possible to construct the IMD at ward level, only the Social Disadvantage Research Centre at the University of Oxford (which constructed the Indices on behalf of CLG) can do so from first principles, as only they have access to all the original, unrounded data.

Local Authority level summary measures

The IMD is created for small areas because that is considered the best way to identify the areas of need. However, it is sometimes necessary to consider higher geographical levels for painting a picture of a wider area to make comparisons or for funding decisions. Most of these higher areas are fairly arbitrary in their geography and exist for administrative or political purposes. Summary measures of the IMD have been published by CLG for a selection of such areas, including local authority areas, so borough level figures have been produced for London. Six different measures of the IMD have been created for local authorities, each focusing on different, but equally valid aspects of multiple deprivation in the district. Therefore no single measure is favoured over another and all should be taken into account. The six measures are:

- Average of LSOA Scores describes the overall position of people in the district by taking the population-weighted average of the scores for each LSOA within the district.
- Average of LSOA Ranks again summarises the district as a whole, taking into account the population-weighted ranks of both the deprived and less deprived LSOAs.
- Extent depicts how widespread high levels of deprivation are in a district by considering the proportion of the district's population living in the most deprived LSOAs in England.
- Concentration identifies districts' 'hot spots' of deprivation by looking at the (population-weighted) average rank of the most deprived LSOAs containing ten per cent of the district's population.
- *The Income Scale* gives the **number** of people in the district who are income deprived.
- The Employment Scale gives the **number** of people in the district who are employment deprived.

Ward level summary measures

There has been a demand within the GLA and from partner agencies for a ward level analysis based on 2010 scores and this Update attempts to address that need. No attempt has been made to produce actual IMD scores but instead this Update presents an analysis at ward level summarising individual LSOA scores within wards to replicate, as far as possible, the local authority level measures published by CLG and gives alternative and additional measures.

The ward level summary measures replicating those at LA level produced here are:

- Average of LSOA Scores
- Average of LSOA Ranks
- Extent
- The Income Scale
- The Employment Scale

The calculations for these are as close as possible to those for the LA level measures and full detail of the calculations is given below.

The Average of LSOA Scores measure describes the ward as a whole and is a population-weighted average for the ward. This is calculated by first multiplying the IMD score for each LSOA by the population estimate for that LSOA. These figures are then summed across all LSOAs within the ward and the result is divided by the total population for that ward (the sum of the LSOA population estimates). This measure takes into account the full range of scores within the ward and the number of people affected by the level of deprivation in each LSOA.

The Average of LSOA Ranks measure again takes into account the full range of deprivation across each ward, but using the ranks of LSOAs rather than the scores. Again it is calculated using the population figures to take account of variation in LSOA sizes, so it is a population-weighted average of LSOA ranks within each ward, but with the ranks reversed, so that the most deprived LSOA is ranked 32482 and the least deprived is ranked 1, so that a higher figure represents higher levels of deprivation.

The *Extent* measure aims to show how widespread significant levels of deprivation are within each ward. Thus, it counts the people in the most deprived LSOAs only. It counts the total population for any LSOA ranked in the top ten per cent in England, and then, in order to avoid a crude cut-off, it also includes a portion of the population in the next 19 per cent on a graduated scale, so that 95 per cent of the population count for LSOAs with a rank between the tenth and eleventh percentiles is included, 90 per cent of the population count for LSOAs with a rank between the eleventh and twelfth percentiles etc down to five per cent of the population count for LSOAs with a rank between the twenty-eighth and twenty-ninth percentiles. None of the population in areas ranked lower than this is included on this measure.

The *Income Scale* measure gives a count of the actual number of people living in households in income deprivation. It is calculated by multiplying the income score for each LSOA by the population for that LSOA. These are then summed across LSOAs within each ward to give the income score for the ward.

The *Employment Scale* measure gives a count of the actual number of people experiencing employment deprivation. It is calculated by multiplying the employment score for each LSOA by the working age population for that LSOA. These are then summed across LSOAs within each ward to give the income score for the ward.

The LA level *Concentration* measure cannot be sensibly reproduced at ward level, since it is based on ten per cent of the area's population, which is in most cases less than a single LSOA. Instead, a summary measure *Highest ranked LSOA in ward* has been included. This effectively answers the same question of "how deprived are the most deprived people in the area?"

Additionally, this Update includes the total number of LSOAs in each ward and gives a count of how many LSOAs are included among the more deprived areas in England. Four such counts are given – the five per cent most deprived, ten per cent, 20 per cent and 50 per cent, or above average.

Results – the ward level summary measures of IMD 2010

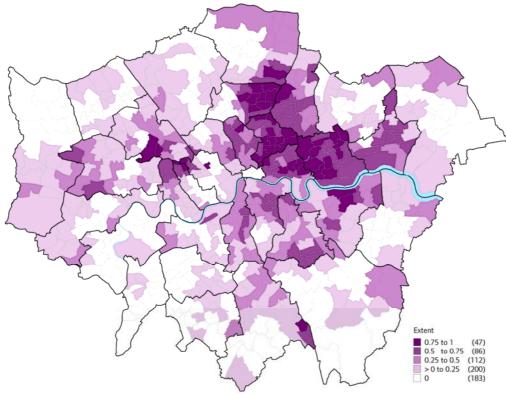

Tables giving the top and bottom wards on each summary measure and maps showing the distribution are given in this section. The full results for all wards are available separately in spreadsheet form, showing the scores and ranks on each summary measure.

Table 1 Most deprived London wards on Extent measure

| · | | | Rank of extent (within London) 1=most deprived | | |

| Forest Gate South | Newham | 0.86 | 23 | | |
| Tottenham Hale | Haringey | 0.85 | 24 | | |
| Woolwich Common | Greenwich | 0.85 | 25 | | |

Source: GLA Calculations based on the Department for Communities and Local Government, Indices of Deprivation 2010

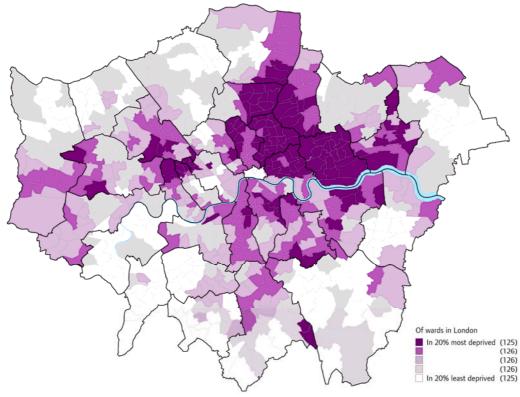

These 25 wards all have an Extent measure of 85 per cent or more. There is just one London ward which has all its LSOAs within the ten per cent most deprived LSOAs nationally and therefore an Extent measure of 1.00 or 100 per cent. 183 wards out of 629 have no LSOAs in the top 29 per cent nationally and therefore 0.00 Extent score.

| Beckton | Newham | 9 | 2 | 3 | 7 | 9 |
| Woolwich Common | Greenwich | 10 | 2 | 5 | 9 | 10 |

Source: GLA Calculations based on the Department for Communities and Local Government, Indices of Deprivation 2010

In London there are 61 wards altogether that have no LSOAs ranked above average nationally, spread across 15 boroughs.

Access to further information

Further information on both the detail of how the indices are constructed and more regional analysis can be found in the full report of the ID2010, The English Indices of Deprivation 2010 published by Communities and Local Government, March 2011. This, together with a summary can be found on the CLG website at: http://www.communities.gov.uk/publications/corporate/statistics/indices2010 The report of the ID2004 can be found at:

http://www.communities.gov.uk/publications/communities/englishindices

The 2010 data for the whole of England can be downloaded from the CLG website (address given above) in Excel format. The individual indicators and the population denominators are also available at the same site.

A separate Intelligence Briefing 2011-06 'English Indices of Deprivation 2010: A London Perspective' giving an analysis of the published data for small areas and for local authorities within London is available, along with an Intelligence Update 02-2012 'Income Deprivation Affecting Children and Older People' giving ward and borough level scores for the supplementary indices at http://data.london.gov.uk/datastore/package/indices-deprivation-2010. A spreadsheet giving the full ward level figures for London, along with all the other London data can also be downloaded from this site.

January 2012
