Marshall Environmental Consulting Limited completed a Land Quality Risk Assessment (LQRA) (referenced MEC161118; dated 6 December 2018) for the development of the site known as Vinegar Yard, London Bridge, Southwark for multi-storey commercial uses and including a three-level basement which was appended to the Environmental Statement as part of the 2018 ES.

The objective of the report was to evaluate land quality risks and constraints associated with the regeneration of the land by completing a desk based evaluation, review of pre-existing site investigation reports and visual assessment of the ground conditions across the site exposed in archaeological inspection trenches.

The LQRA included a robust conceptual site model (CSM) that was able to demonstrate to a high level of certainty that that there were no plausible contaminant linkages that would impact future users, neighbours, controlled waters or environmental receptors post-development. No further assessment or remediation was considered necessary, primarily due to the complete hardstanding cover of the development, removal of the full thickness of the made ground in the basement excavation and soil chemical testing results below commercial end use criteria.

Since the LQRA was completed, the 2018 Proposed Development has been revised since the submission of the planning application in 2018 and therefore a re-evaluation of the CSM is required to make sure the findings remain applicable.

Between 2018 and 2020 the following revisions were made to the scheme:

1. Removal of massing (bulk) from within the conservation area and retention of the existing Warehouse at 9 Fenning Street;
2. Use of the Warehouse as a community-focused use with ground floor retail and first floor community hall space. This replaces the music venue with a more flexible and diverse offer that can work in conjunction with the affordable work space;
3. Creation of a new public garden at the east end of the site, replacing the music venue entrance pavilion and reduction in the extent of the basement so that there is no basement underneath the new public garden. No reduction in public open space is proposed;
4. Provision of a policy compliant on-site affordable work space offer set at 10% of the Proposed Development;
5. Development of a more articulated treatment in the evolved massing and external architectural treatment to respond more sensitively to the adjacent context;
6. Adjustment of the design to allow for flexibility in the final end uses: whether research and development (B1b) or medical (D1) use to facilitate Guy's and St. Thomas' Hospital occupation of the building or, if not, offering lab-enabled research and development space. The changes are primarily an increase in floor-to-floor heights, a more rigid structure (to control vibration, which is an important criterion for medical equipment) and spatial provision for more systems to support the proposed uses within the criteria for healthy and flexible buildings established by the NHS, for instance.
7. Respond to the GLA's agenda that the development should address requirements with regard to Sustainability - Carbon Emissions, Embodied Carbon and Life Cycle Commitments; and
8. Moving the servicing route from along Fenning Street to a loading bay served by the re-routed Vinegar Yard accessed from Snowsfields.

The scheme then continued to evolve since December 2020. A summary of the further changes that have led to the now 'revised' 2021 Proposed Development are detailed below:

9. A reduction in massing to the eastern part of the Main Building resulting in the introduction of a terrace at Level 13;
10. The relocation of affordable workspace entrance to align with the masterplan east – west route;
11. An additional entrance along the northern elevation on ground level to the retail hall and two additional entrances along the southern elevation on ground level to the retail hall;
12. The relocation of gas storage to increase retail frontage at the eastern retail unit;
13. The relocation of one accessible parking space to be provided off-site;
14. Structural and drainage related updates to account for the amended massing; and
15. Minor amendments to the landscaping and urban greening factor as a result of the addition terrace at Level 13.

The proposed changes in the context of the 2021 Proposed Development do not affect the CSM given that the site remains as a commercial development and the building provides complete hard cover.

However, the composition of the Made Ground, as observed in archaeological trench 4 during archaeological work undertaken on site in 2018 (Section 5.1.3 of the LQRA) located in the east of the site, is predominantly demolition type material (sand, brick and concrete). The new proposed layout incorporates a new public garden in the eastern area and therefore the Made Ground material is not a suitable growing medium for the planting. It is recommended that the Made Ground in the east of the site (approximately 2.65m thickness) is therefore removed and a suitable thickness of subsoil and topsoil is imported. The supplier of the subsoil and topsoil should provide laboratory chemical testing results to demonstrate the imported material meet the criteria for open space use.

Trium Environmental Consulting LLP is a limited liability partnership registered in England with no. OC415522 whose registered office is 3 Wellbrook Court, Girton, Cambridgeshire, CB3ONA. References to partners mean members of Trium Environmental Consulting LLP.

1. Executive Summary

Marshall Environmental Consulting (MEC) Limited has completed a Land Quality Risk Assessment to assess the land condition at the Vinegar Yard site. This has been undertaken to identify potential land quality risks and constraints associated with the proposed 19-storey building and 3-storey building (both with 3 basement levels) and to provide information to the Local Planning Authority as part of a pre-application information pack.

The approximately 0.3-hectare site is located in the London Borough of Southwark (LBS). The site is vacant with the exception of two warehouses located in the south west of the site.

The site has a long history of development dating back to the 16th Century and has been through multiple phases of redevelopment. Identifiable site uses in the east of the site include a timber yard, leather warehouse, cardboard box factory and a printing ink and paper store. Centrally the site has been developed as a hop warehouse since 1872 until between the 1960s and 1980s. The west of the site has been developed as residential dwellings, leather, rubber and fruit and food packing warehouses, weighing machine repairs, garages and stables. Since the 1980s the site was used for car parking and most recently as a contractor's storage yard during the redevelopment of the adjacent London Bridge Railway Station. The site is located in a heavily urbanised area and historical surrounding uses were predominantly residential and commercial.

The site suffered bomb damage during WW2, However, the site layout shown in 1951 is similar to pre-war maps and suggests the damage was repairable. Given that the site was heavily developed and operational during WW2 it is unlikely that unexploded ordnance that may have struck the site would have gone un-noticed.

Ground investigations (including laboratory chemical analysis) undertaken in 1998 and 2012 and recent archaeological trenching in November 2018 have provided a valuable opportunity to assess the soil conditions on the site. The upper 20m of geological sequence comprises Made Ground, Alluvium, Kempton Park Gravel and London Clay Formation. Groundwater is within the Kempton Park Gravels and is confined by the Alluvium. Laboratory analysis and visual assessments indicate the made ground does not include contamination that represents a constraint to the Proposed Development and is predominantly demolition material (sand, brick and concrete and relict intact brick foundations). No fragmented asbestos containing materials have been observed in the excavated spoil from the extensive archaeological investigations.

The provision of a deep basement comprising the full footprint of the Proposed Development will remove made ground, Alluvium and Kempton Park Gravel and the basement slab will be founded on the London Clay Formation. Therefore, no plausible contaminant linkages have been identified that will impact future site users, neighbours, controlled waters or environmental receptors post-development. Based on CIRIA C552 criteria, the potential severity of risk is minor and the probability of a risk to future site occupiers/visitors occurring is unlikely. This represents the lowest risk classification in the CIRIA criteria.

No further land quality assessments are considered necessary to evaluate environmental risks at the site given that comprehensive land quality investigations were completed in 1998 and 2012 and extensive visual assessment of archaeological trenches was undertaken in 2018. Mitigation measures are therefore not considered necessary for the completed operational aspect of the Proposed Development given the basement excavation will remove shallow soils to the London Clay Formation bedrock.

It is recommended that the contractors should undertake additional soil and groundwater studies for the assessment and classification of waste soil (from the basement excavation) and groundwater (from dewatering) to determine appropriate waste management licensing and disposal routes for the material that will be removed during the period of construction works.

Although the soils have not been demonstrated to be contaminated, the contractor performing the basement excavation works will need to adopt industry good practices to appropriately manage the excavation of the basement during the period of construction so not to cause nuisance to site neighbours.

2. Introduction

2.1 Terms of Reference

Marshall Environmental Consulting Limited (MEC) was commissioned by Trium Environmental Consulting LLP (the Client), to undertake a Land Quality Risk Assessment (LQRA) at the site known as Vinegar Yard, London Bridge, Southwark (the "site").

2.2 Proposed Development

The Proposed Development will provide for a 19-storey building (plus ground and mezzanine levels) and 3-storey building (both with 3 basement levels) comprising a range of commercial floor space. Illustrative plans are indicated in Figure 2.2a to 2.2f below.

In the central and west of the site will be the 19-storey building and in the east of the site will be the 3-storey building. A parapet level at ground level is located between the main building and the entrance to the 3-storey building.

There is proposed to be three levels of basement providing a range of commercial uses including: A1-4, B1, D2 and Sui Generis. The finished floor level across the full footprint of the 3rd basement level is -9.70m AOD (13.3m below the surrounding street level; Figure 2.2f).

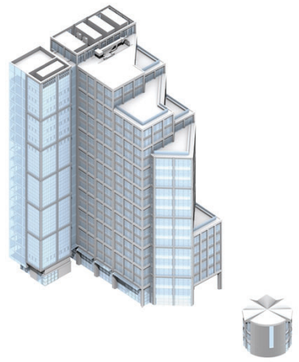

Figure 2.2a: Proposed Layout (aspect from south-east)

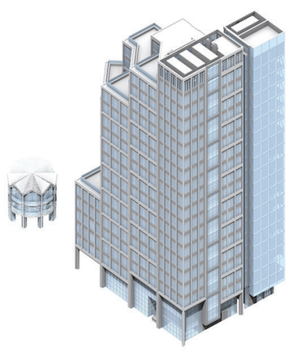

Figure 2.2b: Proposed Layout (aspect from north-west)

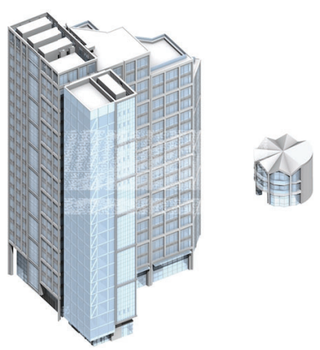

Figure 2.2c: Proposed Layout (aspect from south-west)

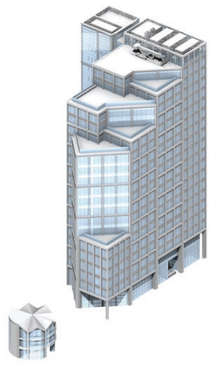

Figure 2.2d: Proposed Layout (aspect from north-east)

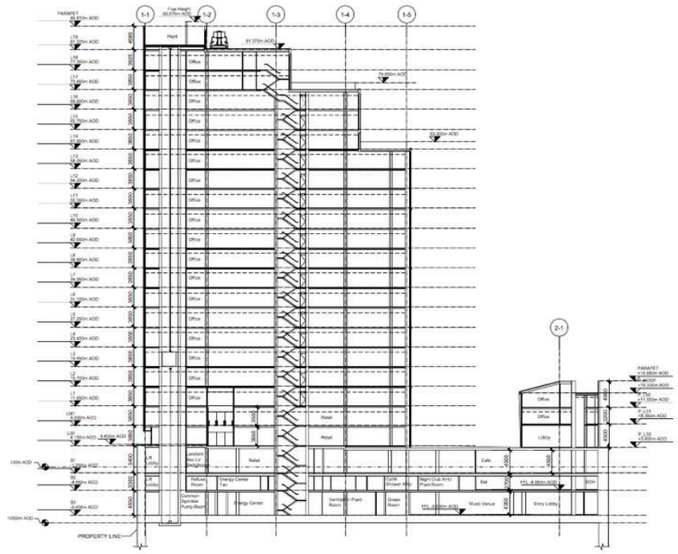

Figure 2.2e: Proposed Typical Long Section (27 Nov 2018)

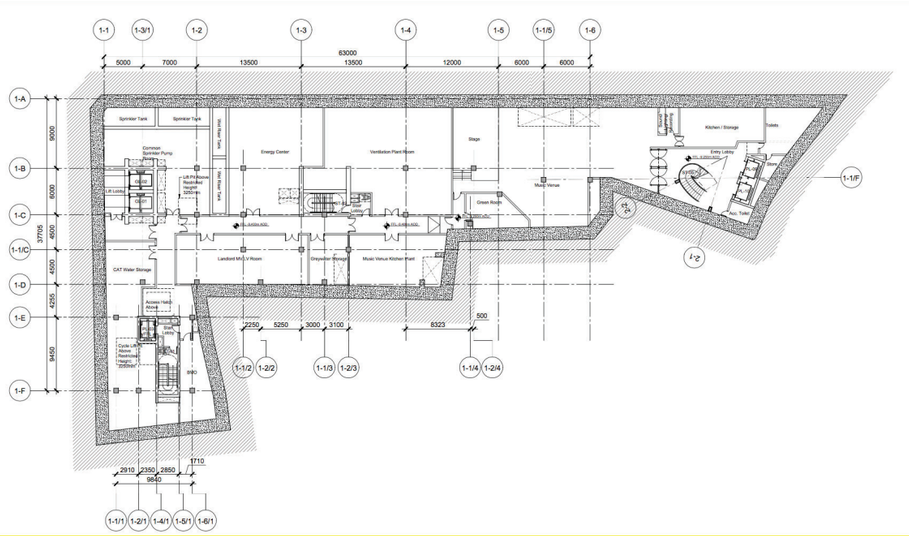

Figure 2.2f: Third level of Basement Layout (27 Nov 2018)

2.3 Objective

The objective of the LQRA is to identify potential land quality risks and constraints that may be associated with the proposed regeneration of the land and to provide information to the Local Planning Authority as part of a pre-application information pack. For clarification, this LQRA does not consider the geotechnical aspects of foundation and retaining wall design for the development.

2.4 Methodology

The assessment presented in this report and the recommendations provided have been prepared in accordance with the following key guidance:

- National Planning Policy Framework (NPPF) and associated Planning Practice Guidance;
- British Standard 10175:2011+A2:2017 'Investigation of Potentially Contaminated Sites – Code of Practice';
- Contaminated Land Report (CLR) 11 'Model Procedures for the Management of Land Contamination' (2004);
- DEFRA: Environmental Protection Act 1990: Part 2A Contaminated Land Statutory Guidance (April 2012);
- Environment Agency (EA), March 2017. The Environment Agency's approach to groundwater protection. Version 1.0; and
- London Borough of Southwark (October 2003). Guidance for Developers and Contractors Redeveloping Contaminated Land.

This report considers the implications of Part 2A of the Environmental Protection Act 1990 and the associated Contaminated Land (England) Regulations 2006 (and 2012 amendment) as material planning considerations through the Town and Country Planning Act 1990.

The following tasks have been performed:

- A review of the geological, hydrological, hydrogeological and ecological setting at the site, and public domain geo-environmental information to develop an understanding of the environmental setting/sensitivity of the site and its surroundings;
- Review of historical land uses for the site and surrounds to identify potential ground hazards and potential on-site and off-site contamination sources;
- Review of existing Environmental Desk Study and Site Investigation reports;
- Site inspections, including excavations made for archaeological investigation purposes; and
- Preparation of a Conceptual Site Model (CSM) with a view to identifying potentially significant source-pathway-receptor linkages and a qualitative risk assessment.

2.5 Sources of Information

The information and documents reviewed for the purpose of this report are given below:

1. Ashdown Site Investigation Limited (February 2012). Geo-environmental Data and Historical maps. Referenced LW23042/map;
2. Ashdown Site Investigation Limited (March 2012). Geotechnical and Contamination (Phase I & II) Assessment Report. Referenced LW23042 (this report includes appended extracts and information from a previous Site Investigation completed by Ashdown Site Investigation Limited in August 1998; extracts from the 1998 and 2012 assessments are included as Appendix C);

3. Site Details

3.1 Site Location

The site is approximately 0.3-hectare in area and is located at National Grid Reference 533100,179930 in the London Borough of Southwark (SE1) (Figure 3.1a). The site is surrounded by St Thomas Street, Vinegar Yard, Melior Street, Fenning Street and Snowsfields (Figure 3.1b) and is immediately south of the railway approach viaduct to London Bridge Station, is 400m south of the River Thames and 210m south-east of The Shard.

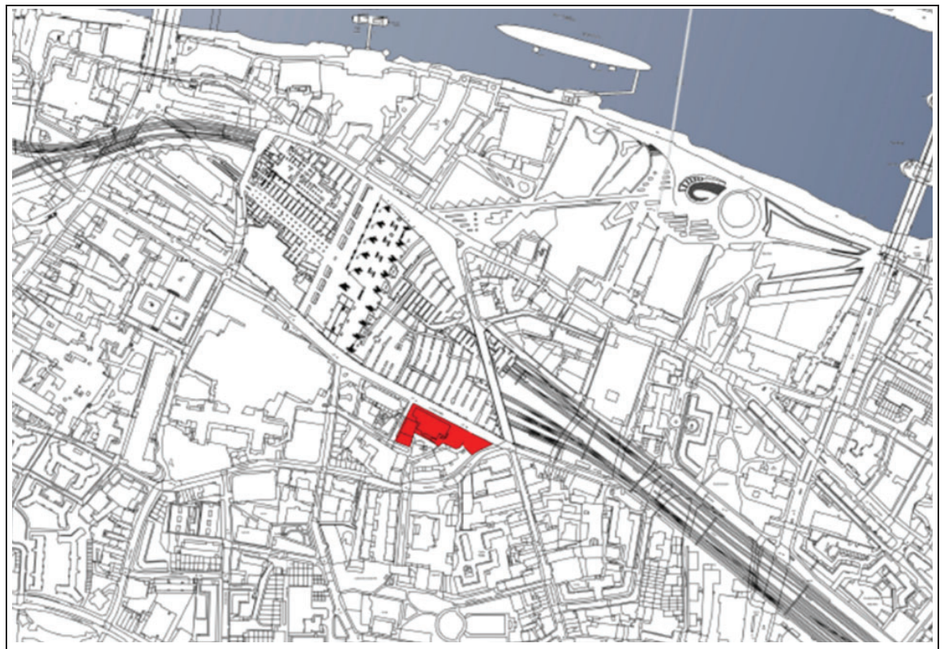

Figure 3.1a: Site Location Plan

Figure 3.1b: Site Location Plan (indicative) and Aerial Photograph

3.2 Site Description

Site walkover inspections were undertaken on 4 September 2018 and the 9 and 13 November 2018 and indicated the following site uses:

1. Main Site: During the site visit on 4 September 2018 the site was an active construction site used by Costain (a technology based construction and engineering company) for the storage of scaffolding equipment and temporary site cabin offices in support of the adjacent London Bridge Station refurbishment. Heavy plant was observed braking-out a former building floor slab on the main site on 4 September 2018. The site manager indicated the yard had been used as a contractor's storage compound for scaffold supplies for the past six years and the contractors were in the process of demobilising. Archaeological investigations were being carried out during the visits on 9 and 13 November 2018 (see Section 5.1.3). The surfacing in November 2018 was formed by compacted sand and concrete.
2. Warehouse: During the site visit in 4 September 2018 the buildings (labelled as 2 on Figure 3.2) were used by Network Rail as site offices and changing facilities. During the visit on 9 November 2018 the buildings were empty and vacant.

Vinegar Yard provides an access to the site, but is a no-through road. Costain were observed to be continuing to use Vinegar Yard as equipment storage during the November 2018 site visits.

Photographs of the site taken during the site visits are included as Appendix A.

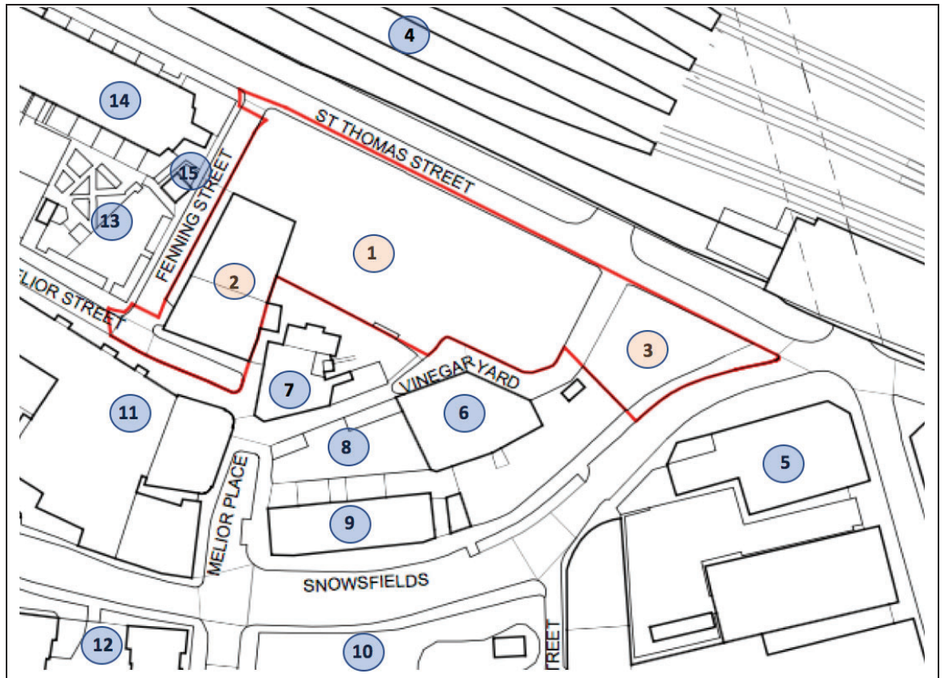

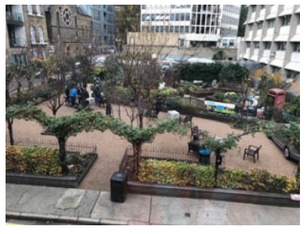

Figure 3.2: Site (indicative red line) and Surrounding Land Use Plan

3.3 Surrounding Area

The site is in a densely urbanised area surrounded primarily by residential and commercial uses. Pertinent Land uses within 200m of the site boundary determined from online mapping imagery and the site visits are summarised in Table 3.3 below. Additional photographs of the surrounding area are included as Appendix A.

Table 3.3: Surrounding Land Use

Direction	Description	Photograph
North:	Immediately north is St Thomas Street, beyond which are railway viaduct arches used as small retail outlets and cafes and access to the underground parking and delivery area of the London Bridge Station. Above the arches is the London Bridge Station railway approach Viaduct. 400m north is the River Thames.	 Photo of St Thomas Street with the railway viaduct in the right and the site on the left. View looking west.
East:	The site is immediately bordered by Snowsfields (street), beyond which is a four-storey building including the Bermondsey Yard Café at ground level and residential apartments on the upper floors. Further east the land along Bermondsey Street and Crucifix Lane is heavily urbanised with commercial outlets and residential apartments.	 Photo of St Thomas Street with Bermondsey Yard buildings in the background. View looking east-northeast.
South:	To the south of the eastern extent of the site is Vinegar Yard (no-through road) beyond which is a disused four storey warehouse building and yard. South of the central section of the site is the Horseshoe Inn and a parking area. A four-storey residential apartment building is located 30m south and, beyond which is Snowsfields (street). 55m south is the Snowsfields Primary School. South of the western extent of the site is Melior Street, beyond which is a newly constructed six storey building including ground floor café and residential apartments. The Guinness Trust residential apartments are 50m south.	 Photo of Melior Street residential buildings. The warehouse located in the south-west of the site is visible in the right of the photograph. View looking west
West:	The site is immediately bordered by Fenning Street. To the west of the northern extent of the western boundary is a seven storey Home Office building. To the west of the southern extent of the western boundary is Melior Street Community Garden. Further west the land is developed with multi-storey office buildings. 30m west is the Slovak Catholic Mission Church. Guys Hospital is 100m west. The Shard is 210m north-west of the site.	 Photo of Fenning Street, community garden and Home Office building. View looking west.

4. Site History & Development

4.1 Approach

The history of the site and surrounding area was assessed based on the review of available historical documentation (Landmark maps, site plans, insurance maps etc.) and discussions with site management and the site reconnaissance. In addition, an Archaeological Desk Based Assessment has been completed by Mills Whipp Projects (dated September 2018), which includes maps that pre-date Ordnance Survey.

The historical ordnance survey maps are included with the EnviroCheck Landmark report as Appendix D.

4.2 Historical Development

Historical maps indicate that the site and its surrounds has been developed since at least the 1600s. The pre-Ordnance Survey maps do not show details of the land uses on the site, but do show that the site has been through a number of development cycles and different layouts. A summary of the on- and off-site pertinent developments is indicated in Table 4.2.

Table 4.2: Historical Development of the Site and Surrounding Area

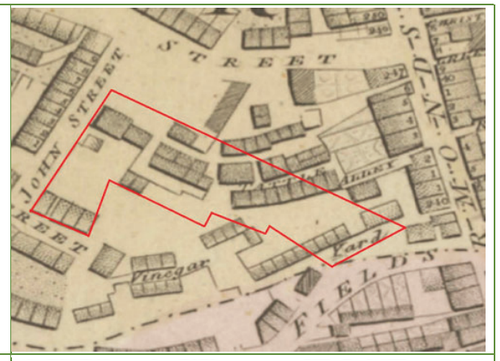

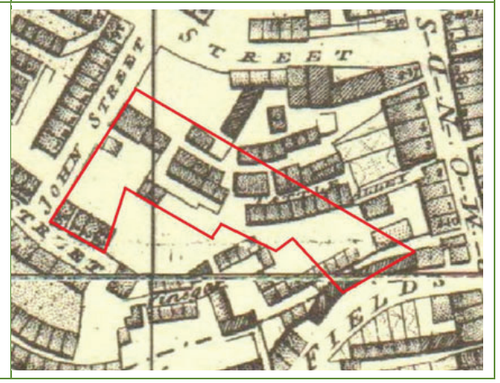

Date	Description	Map Extract
Horwood 1799	The site and surrounding area is developed with small buildings potentially representing residential properties or small businesses.	
Horwood 1813	The map shows no significant changes to the previous 1799 map.	

Table 4.2: Historical Development of the Site and Surrounding Area

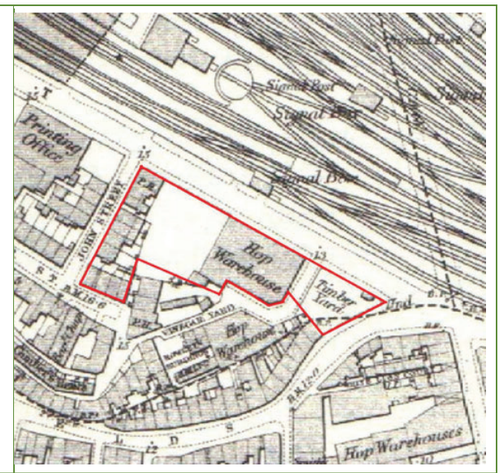

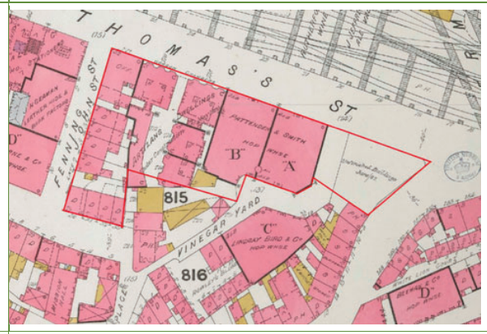

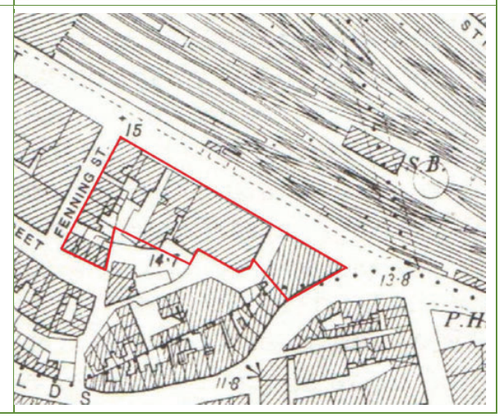

Date	Description	Map Extract
Ordnance Survey 1872	The map shows the previous development of smaller buildings have been removed. The site is developed in the east with a Timber Yard, in the centre with a Hop Warehouse and in the west with open space and small buildings possibly representing residential properties. To the north the London Bridge railway approaches have been constructed (completed in 1836). Surrounding the site are a mixture or residential buildings, Hop Warehouses and a Printing Office. The Public House (now known as the Horseshoe Inn) is located immediately south of the site.	
Goad 1887	The Goad plan shows the Timber Yard formerly in the east of the site is now the position of unfinished buildings. In the centre of the site is the Pattenden & Smith Hop Warehouse, in the west are dwellings and buildings labelled as Artizans (under construction). The surrounding land is predominantly developed with dwellings and Hop Houses. To the west is the Seaman Leather Hide and Bark Factory, Stationers and Warehouses.	
Ordnance Survey 1894	The map shows the east of the site has been developed with a building. The remainder of the site and surrounding land is generally unchanged.	

Table 4.2: Historical Development of the Site and Surrounding Area

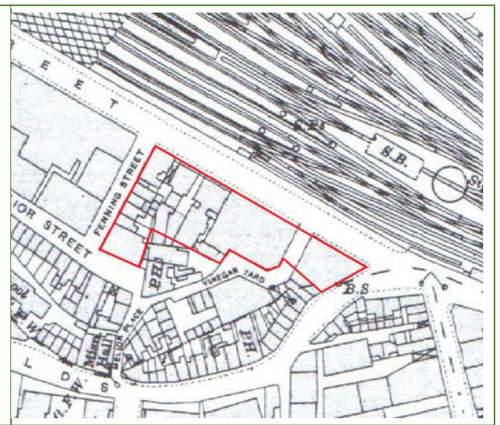

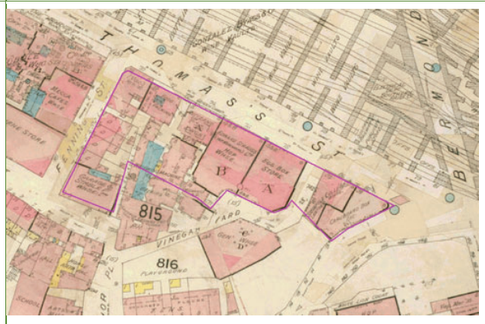

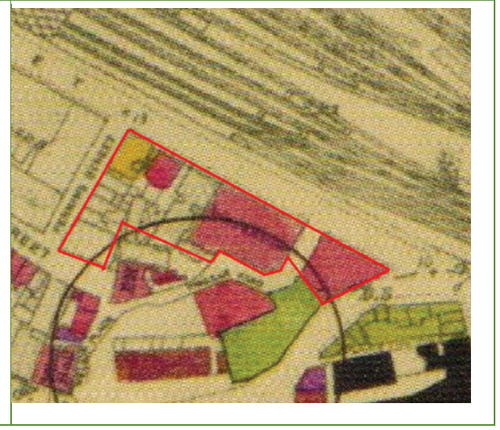

Date	Description	Map Extract
Ordnance Survey 1914	The site and surrounding land layout is generally unchanged since 1887	
1945 Insurance Plan	The 1945 map shows the buildings in the east of the site are Leather Warehouse and Cardboard Box Factory. The Edward Strauss Hop Warehouse is in the centre of the site. A Weighing Machine Repair business, Food Packing and Garage and Stable Warehouse are in the west. Terraced residential properties are located along the western boundary with Fenning Street. The offsite buildings immediately south are part of the Weighing Machine Repairs business, a Sausage Casing Factory and a Leather Warehouse. West is a Furniture Store, Warehouse and Stationers.	
London County Council Bomb Damage Maps 1945	The bomb damage maps indicate a V2 rocket struck near the site within the circular annotation. The buildings in the east, centre and west of the site (coloured red) were seriously damaged but repairable at cost. The buildings in the east (yellow) suffered minor blast damage. The remainder of the western site area was undamaged, as was the land to the west. Offsite to the south-east the land coloured black suffered total destruction and the green areas were clearance areas. Buildings to the south, including the warehouse and Public House, also suffered serious damage.	

Table 4.2: Historical Development of the Site and Surrounding Area

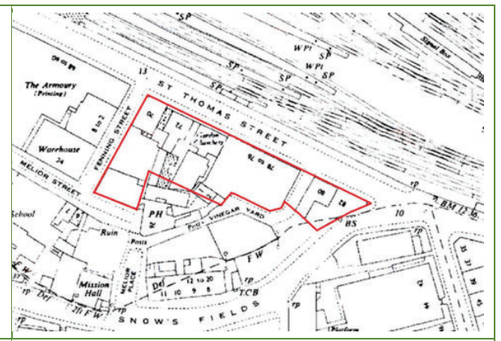

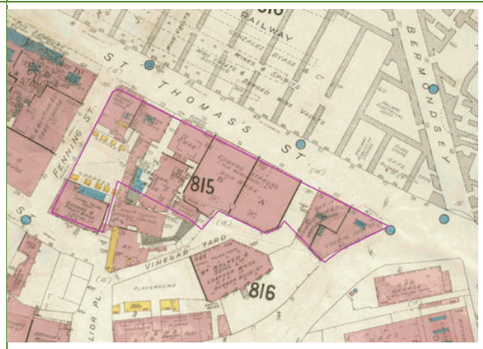

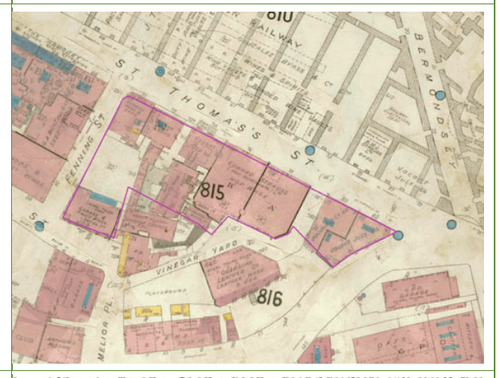

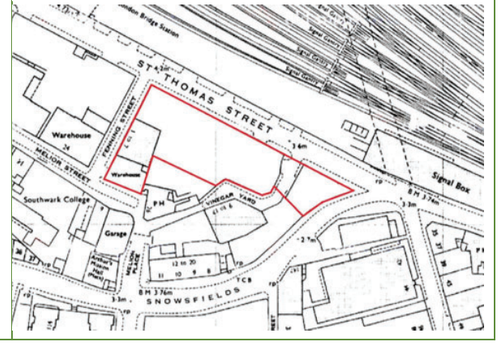

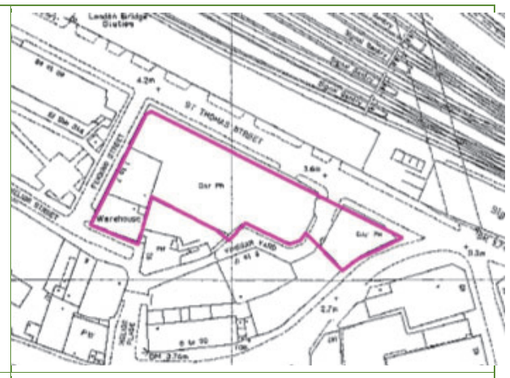

Date	Description	Map Extract
Ordnance Survey 1951	The 1951 map show the site area to be fully developed with buildings. The only label is the Gordon Chambers in the centre-west of the site. A food factory is shown 45m south-east, ruins immediately south, a school 25m south-west and to the west is a Warehouse and The Armoury (stationers).	
1957 Insurance Maps	The 1957 map shows the buildings in the east of the site are Leather Warehouse and Printers Ink and Paper Store. The Edward Strauss Hop Warehouse remains in the centre of the site. The land in the west is vacant buildings, Leather Warehouse, Rubber Warehouse and a Garage and Stable Warehouse. The terraced residential properties along Fenning Street have been removed and are now garages.	
1966 Insurance Plan	The 1966 map shows the buildings in the east of the site are vacant. The Edward Strauss Hop Warehouse remains in the centre of the site. Warehousing for carpets, rubber, leather and fruit are located in the west of the site. The land in the west where the current warehouse is located is undeveloped (garages shown in 1957 are removed). The offsite buildings immediately south are a Sausage Casing Factory and a Leather Warehouse and west is a Seed and Hop Warehouse.	
Ordnance Survey 1982	The 1982 map shows little detail and indicates the site buildings have been removed with exception of the warehouses in the west. Immediately south is a garage and south-west the school is shown as Southwark College.	

Table 4.2: Historical Development of the Site and Surrounding Area

Date	Description	Map Extract
Ordnance Survey 1995	The 1995 map shows little change from the previous 1982 map, but shows the site is labelled as a car park. Offsite to the west the Home Office building and community garden have been constructed.	
1999 Aerial Photograph	The 1999 aerial photograph shows the site is undeveloped except for the existing warehouse buildings in the west. The site is used for car parking.	

4.3 Site Development Summary

The historical maps indicate that the site has had a long history of development dating back to the 16th Century and has been through multiple phases of redevelopment.

Identifiable site uses in the east of the site include Timber Yard, Leather Warehouse, Cardboard Box Factory, Printing Ink and Paper store. Centrally the site has been developed with a Hop Warehouse since 1872 until between the 1960s and 1980s. Part of the Hop Warehouse was used as an egg box store in 1945. The west of the site has been developed with residential dwellings, leather warehouse, rubber warehouse, weighing machine repairs, garages, stables and fruit warehouse and a food packing warehouse.

Excavations made for archaeological investigation purposes in November 2018 exposed the bases of two former tanning barrels buried beneath the former Hop Warehouse slab and indicates that small scale tanning was undertaken on the site prior to the mid-1800s (see Section 5.1.3).

Offsite the London Bridge railway is present to the north from the late 1800s. Historical surrounding land uses generally includes residential dwellings, Hop Warehouses, Stationers, Hide and Bark Factory and a Sausage Casing Factory. The historical maps also show that a Tannery was located 140m south and beyond the current Guinness Buildings and the Snowsfields Primary School from at least 1896 until between1968 and 1980. The former Tannery location is now the Leathermarket Gardens.

The site suffered bomb damage during WW2, However, the site layout shown in 1951 is similar to pre-war maps and suggests the damage was repairable. Given that the site was heavily developed and operational during WW2 it is unlikely that unexploded ordnance that may have struck the site would have gone un-noticed. Ruins are shown on the land to the south on the 1951 maps.

5. Environmental Setting

5.1 Geology

5.1.1 Published Geology

The British Geological Survey (BGS) Geology of Britain Viewer indicates the site is underlain by a deepening sequence of superficial Alluvium and Kempton Park Gravel followed by London Clay Formation (Thames Group) bedrock. Below the London Clay is Woolwich and Reading Beds Formation and Thanet Sand Formation of the Lambeth Group followed by the Chalk Group.

The BGS Geology of Britain Viewer indicates that there are four publicly available borehole logs within 60m of the site. The geological sequence shown on the logs, and represented in Table 5.1.1 confirms the shallow geology published by the BGS. The four BGS borehole logs are included as Appendix B.

Table 5.1.1: Geological sequence From British Geological Survey Borehole Logs

Borehole	Location	Geological Sequence
TQ37NW2252 (December 1980)	15m west	5.8m of made ground comprising concrete, brick and timber rubble Sandy gravel to 9.65m London Clay to 20m
TQ37NW2251 (December 1980)	35m west	0.9m of made ground comprising concrete and brick rubble Silty clay Alluvium to 4.9m Sandy gravel to 9.85m London Clay Formation to 25m
TQ37NW2250 (December 1980)	60m west	1.0m of made ground comprising concrete and brick rubble. Silty clay Alluvium to 4.9m Sandy gravel to 11.0m London Clay Formation to 20m
TQ37NW2262 (December 1996)	50m east	3.4m of made ground comprising silty clay with brick, ash, coal and sand Sandy gravel to 8.70m London Clay Formation to 33.1m Very stiff silty clay (Woolwich and Reading Beds) to 36.0m (base not encountered)

Deeper boreholes that have penetrated through the Lambeth Group and into the Chalk Group are located 180m south-east (TQ37NW1227, drilled 1889), 230m south (TQ37NW89, drilled 1876) and 375m west (TQ37NW/1230, drilled 1859). These boreholes indicate the geological boundary between the base of the Woolwich and Reading Beds Formation and top of the Thanet Sand Formation is at approximately 42.4m to 46.3m and the top of the Chalk Group is at 55.2m to 60m below ground level (bgl) in the general area of the site.

5.1.2 Site Geology - Previous Investigation Ground Conditions

The ground conditions shown on borehole logs from site investigations undertaken by Ashdown Site Investigations Limited in 1998 and 2012 are shown in Table 5.1.2 below and discussed further in Section 7. The logs are also included as Appendix C. The Ashdown site investigation data corroborates with the published shallow geological information and show a deepening sequence of made ground, Alluvium, River Terrace Gravel and London Clay Formation.

The full thickness of made ground was penetrated at seven exploratory positions and indicates thicknesses between 1.2m and 3.3m. Ashdown report the Made Ground comprises coarse gravel and silty clays with cobble sized brick, flint, concrete, coal, ash, wood, clinker, quartz and glass. Below the Made Ground is Alluvium which was found to depths between 4.3m and 6.4m bgl and has thicknesses between 1.1m and 3.95m. The base of the River Terrace Gravels was found to be between 8.9m and 10.95m bgl with thickness between 3.2m and 4.6m.

The London Clay Formation is below the River Terrace Gravels and was proven to the maximum depth of the investigation at 20m bgl.

Table 5.1.2: Geological sequence From Ashdown Borehole Logs

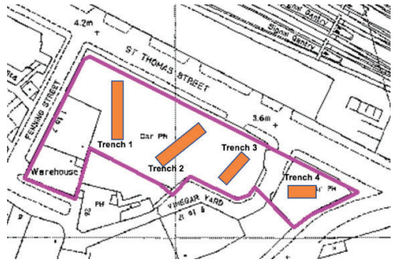

Borehole	Made Ground	Alluvium		Kempton Park Gravel		London Clay Formation	
	Depth to Base	Depth to Base	Thickness	Depth to Base	Thickness	Depth to base	Thickness

5.1.3 Archaeological Trench Inspections

An inspection of four archaeological trenches was undertaken on 9 and 13 November 2018. A description of each trench is given below. Additional photographs of the excavations are included as Appendix A.

Table 5.1.3: Archaeological Trench Inspections

Trench	Description	Plan / Photograph
	Archaeological trench location plan	
Trench 1:	Trench 1 was 21m long and 4.25m at its deepest point. The sequence included: Surface to 0.75m: sand and concrete hardcore with some metal re-bar. 0.75 to 1.25m: green sand and granite gravel and cobble hardcore with some crushed glass inclusions. 1.25 to 1.5m: relic foundations and brickwork. Reworked silt with charcoal and brick inclusions excavated in the southern extent. 1.5 to 4.25m. moist green Alluvium (silty clay).	 Photo of Trench 1. View looking north-northwest.

Trench	Description	Plan / Photograph
Trench 2 (southern extent outside the former Hop Warehouse Footprint)	Trench 2 was 20m long and 2.6m at its deepest point in its southern extent. The sequence included: surface to 0.5m: sand and concrete hardcore with some metal re-bar. 0.5 to 0.8m: green sand and granite gravel and cobble hardcore with some crushed glass. 0.8 to 2.3m: reworked Alluvium with brick inclusions. 2.3 to 2.6. moist green Alluvium (silty clay) with some brown peat. The brick foundation of the former Hop warehouse transects the mid-point of the trench.	 Photo of southern extent of Trench 2. View looking north-east.
Trench 2 (northern extent within the former Hop Warehouse Footprint)	Trench 2 was 20m long and 2.8m at its deepest point in its northern extent. The sequence included: surface to 0.4m: sand and concrete hardcore with some metal re-bar. 0.4 to 0.85m: green sand and granite gravel and cobble hardcore with some crushed glass. 0.85 to 1.75m: yellow and brown sand with many bricks (infilled former Hop Warehouse basement level). 1.75 to 1.8m: tarmac (former Hop Warehouse basement floor). 1.8 to 2.3m. yellow sand and concrete fragments. 2.3 to 2.8m brown silty clay with some brick (reworked Alluvium).	 Photo of northern extent of Trench 2. View looking south-west.
Trench 3 (within the former Hop Warehouse Footprint)	Trench 3 was 12m long and 2.8m at its deepest point. The sequence included: surface to 0.4m: sand and concrete hardcore with some metal re-bar. 0.4 to 1.05m: yellow and brown sand with bricks. 1.05 to 1.1m. tarmac layer (former Hop Warehouse floor) 1.1 to 1.47m. yellow and brown sand and gravel fil. 1.47 to 1.7m: relict brick foundations, reworked silt and evidence of two former wooden tanning pits / barrels.	 Photo of Trench 3. View looking north.
Trench 4	Trench 4 was 6m long and 4.65m at its deepest point. The sequence included: surface to 0.7m: sand, brick and concrete. 0.7 to 2.35m: yellow and brown sand with bricks and relict intact brick foundations (infilled former Hop Warehouse basement level). 2.35m: tarmac layer (former Hop Warehouse floor). 2.35m to 2.65mm. yellow and brown sand and gravel fil. 2.65 to 3.65m: grey green Alluvium 3.65m to 4.65m: wet yellow brown sand (Kempton Park Gravel).	 Photo of Trench 4. View looking north-east.

5.1.4 Unexploded Ordnance

During the recent archaeological works at Vinegar Yard undertaken by Pre-Construct Archaeology Limited (see Section 5.1.3), a qualified UXO Engineer was contracted to supervise the excavations. Their presence was considered necessary owing to the absence of a UXO desk-top study and a presumed minimum Medium risk of UXO given the sites' proximity to a mainline railway station and recorded bomb strikes (see Section 4.3). The UXO Engineer's brief was to monitor all machine excavations through non-natural ground and to use magnetometer probes to scan the basal alluvial deposits, in advance of augers being drilled, to check for metallic objects that could represent buried UXOs that may have penetrated to the lower horizons. In no trench were any suspicious metallic items observed.

5.1.5 Ground Stability and Mining Hazards

The Landmark EnviroCheck report (Appendix D) provides details of geological and ground stability hazards, which are summarised in Table 5.1.4 below.

Table 5.1.4: Landmark EnviroCheck listed geological and ground stability hazards

Hazard Category	Site Hazard
Coal Mining	No hazard
Collapsible Ground	No hazard
Compressible Ground	Moderate
Ground Dissolution	No hazard
Landslide Ground	Very low risk
Running Sands	Very low risk
Shrinking/swelling Clay	Low

5.1.6 Radon

The Landmark EnviroCheck Report indicates that the site is in a Lower probability radon area (less than 1% of homes are estimated to be at or above the Action Level). The EnviroCheck Report (source data: BGS and National Geoscience Information Service) states that radon protection measures are not required in any area of the site during the construction of new dwellings and extensions.

5.2 Hydrogeology

The EA groundwater maps show that the superficial deposits (Alluvium and Kempton Park Gravel) underlying the site are classified as a Secondary (undifferentiated) Aquifer. The bedrock underlying the Site (London Clay Formation) is classified as an unproductive stratum. The deeper Lambeth Group are Secondary Aquifers and the Chalk Group is a Principal Aquifer.

- Principal Aquifers are described by the EA as layers of rock or drift deposits that have high intergranular and/or fracture permeability - meaning they usually provide a high level of water storage. They may support water supply and/or river base flow on a strategic scale.
- Secondary-A Aquifers are described by the EA as permeable layers capable of supporting water supplies at a local rather than strategic scale, and in some cases forming an important source of base flow to rivers.
- The Secondary-B Aquifers are defined by the EA as predominantly lower permeability strata which may in part have the ability to store and yield limited amounts of groundwater by virtue of localised features such as fissures, thin permeable horizons and weathering.
- Secondary Undifferentiated has been assigned in cases where it has not been possible to attribute either category A or B to a rock type. In most cases, this means that the layer in question has previously been designated as both minor and non-aquifer in different locations due to the variable characteristics of the rock type.
- Unproductive strata are defined by the EA as rock layers or drift deposits with low permeability that have negligible significance for water supply or river base flow.

The site is not within a Source Protection Zone (SPZ) designated by the EA for the protection of potable water supply.

Groundwater was not encountered during the 2012 Ashdown investigation, which was progressed to a depth of 2m bgl. However, groundwater was measured at depths between 3.58m and 4.83m bgl during the Ashdown 1998 monitoring of the deeper boreholes installed to 5m bgl.

Archaeological Trench 1, excavated to approximately 4.25m bgl on 9 November 2018, did not strike groundwater. Groundwater may therefore be confined beneath the Alluvium and within the underlying Kempton Park Gravel.

5.3 Hydrology

The nearest surface water feature is the River Thames located 380m north.

5.4 Flooding

The EA Flood Maps indicate that the site is in a flood risk zone 3 (regarded as high risk, but the area benefits from being mitigated by the presence of flood defences).

A Stage 2 Drainage Assessment completed for the scheme by AKTII Ltd (dated December 2018) also indicates the site would be categorised as being within Flood Zone 3a (an area assessed as having a 1 in 100 or greater annual probability of River Flooding (>1%) or a 1 in 200 or greater annual probability of flooding from the sea (>0.5%)). However, the site benefits from the presence of well-maintained flood defences along the River Thames. According to the Environment Agency Product 4 data, the Thames barrier and associated defence system has a 1 in 1000-year standard which means it ensures flood risk is managed up to an event that has 0.1% annual probability. The ATKII Ltd report also indicates the site has been assessed as being at very low risk of flooding from rivers or tidal flooding, low risk from surcharging sewers and low risk from groundwater or artificial sources. The ATKII Ltd report indicates that the site is at risk of flooding from surface water on St Thomas Street and Vinegar Yard and therefore mitigation measures will be required as part of the design stage.

5.5 Sensitive Sites

The Defra Magic Website of statutory natural environment information and Landmark EnviroCheck report do not indicate sites of ecological importance within a 250m search radius of the site.

6. Regulatory Records

The following section presents a summary of the environmental conditions at and within a 250m radius (and further where considered relevant for context) of the site, summarised from the Landmark EnviroCheck Report (Appendix D).

6.1 Discharge Consents and Groundwater Abstractions

There are no registered consented discharges or abstractions within 250m of the site. The nearest groundwater abstraction is 352m north-east at City Hall for drinking, cooking and sanitary purposes. This borehole was first permitted by the Environment Agency in November 2001 and is indicated to be from groundwater, but the abstraction depth details are not provided. The BGS Geology of Britain Viewer includes a borehole located at City Hall (TQ38SW3392) which was drilled in 2000 to 128m bgl and penetrated the top of the Chalk at 65m bgl. Groundwater pump tests undertaken in the borehole immediately after its construction achieved 24 litres per second over a 10-day period. It is likely that this borehole represents the groundwater abstraction point located at City Hall and indicates the abstracted groundwater is from the deeper chalk aquifer.

6.2 Local Authority Pollution Prevention and Controls

The Landmark report indicates the nearest currently permitted Local Authority Pollution Prevention and Control (LAPPC) licence is 243m west and is for dry cleaning purposes. A revoked authorisation (dated 1993) is also indicated 223m south-east for hide and skin preparation. No other LAPPCs are located within 250m of the site.

6.3 Hazardous Substances Consent

There is one A hazardous substance consent located within 2km of the site, which is held by Cancer Research UK Ltd 193m north-west of the site.

6.4 Contraventions

There are no registered prosecution or enforcements relating to pollution within 250m of the Site.

6.5 Landfills and Waste Management Facilities

There are no current or historical landfill sites, licensed waste management facilities or potentially infilled land within 250m of the site.

6.6 Contemporary Trade Directory Entries

The Landmark EnviroCheck Report lists two active trade directory entries for businesses within 100m of the site (Printers and Cleaning contractor). There are 14 inactive entries for cabinet makers, carpet manufacturers, builder's merchants, office furniture suppliers, leather merchants, freight forwarders and printers.

6.7 Fuel Station Entries

There are no fuel stations within 250m of the Site.

6.8 Sites Determined as Contaminated Land under Part IIA EPA 1990

There are no records of sites determined as contaminated land under section 78R of the Environmental Protection Act within 2km of the site.

6.9 Radioactive or Hazardous Substances

The nearest Registered Radioactive Substances is 239m west at a dental school. Further Registered Radioactive Substances are listed 388m north-west at Guys Hospital.

There are no Control of Major Accident Hazards Sites, Explosive Sites, Notification of Installations Handling Hazardous Substances, or Planning Hazardous Substances Consents or Enforcements within 2km of the site.

7. Documentary Review

MEC has been provided with a Geotechnical and Contamination (Phase I & II) Assessment Report included as report reference 2 in Section 2.5. Pertinent information from the review of the document is indicated below.

7.1 Phase I & II Geotechnical and Contamination Assessment

Ashdown Site Investigation Limited (March 2012). Geotechnical and Contamination (Phase I & II) Assessment Report. Referenced LW23042.

The report includes a review of the environmental data and historical maps included in the Ashdown Geo-Environmental Data and Historical maps report. The report also includes the findings of a site investigation also undertaken by Ashdown Site Investigation Limited in October 1998. Pertinent information extracted from the report by MEC is presented below.

7.1.1 Desk Study 2012

- The author indicates the objective of the investigation was to complete a geotechnical and contamination assessment of the site which was initially to be used for temporary site offices and then assumed for a future redevelopment for residential uses with landscaping;
- The author indicates that at the time of the walkover (date not provided) the eastern part of the site was used for car parking and the western part as a Network Rail storage compound with the site surfacing indicated to have comprised hardcore, crushed stone and patches of tarmacadam. In the south-western corner was a disused two-storey warehouse building with concrete floor;
- The author noted the presence of an electrical substation 20m offsite to the west on the west side of Fenning Street;
- The author indicates the expected geological sequence was superficial deposits of Alluvium underlain by London Clay Formation bedrock;
- The author reports no significant landslips or faults and no significant risk from mining cavity or extractions;
- The author indicates there are no landfills or waste sites that are likely to impact the site and indicate the nearest closed landfill is 987m north-west;
- The author indicates the Alluvium is classified by the Environment Agency as a Secondary (undifferentiated) Aquifer and the London Clay Formation is unproductive strata. The author reports the nearest groundwater abstractions are 353m and 376m north-east of the site and are for potable uses. However, the site is not located within a Source Protection Zone for potable water supply abstractions;
- The author indicates the nearest surface water course is the River Thames 474m north. The author indicates the site is within an Environment Agency Zone 2 and 3 floodplains. However, the site benefits from Thames Barrier flood defences;
- The author indicates the site was developed with buildings from at least 1871 and has been subjected to a number of phases of development. Surrounding land uses are indicated as mixed commercial, residential and railway. A tannery is indicated to be 150m south;
- The author indicated potential sources of contamination identified from the desk based research to include:
  - Petroleum hydrocarbons from the car park use and polycyclic aromatic hydrocarbons (PAH);
  - Petroleum hydrocarbons from the site use as a Network Rail Compound;
  - Potential for ground gas associated with the presence of Alluvium;
  - Metal, PAH and asbestos contaminated made ground from historical phases of development on the site;
  - Metal, PAH, phenol and volatile organic compounds associated with a timber yard use on the eastern part of the site; and

  - The author indicates no offsite sources of contamination were identified and indicate the substation is of recent construction.
- The author performed a qualitative assessment of risk to human health associated with the potential contaminant sources by direct contact, inhalation and ingestion of soil dust and vapours and reported the risks to be low or low/moderate; and
- The author indicated the risk to groundwater was negligible or very low given the low solubility of metal and PAH contamination that may be present and the sensitivity of the controlled water receptor at this location.

7.1.2 Site Investigation 2012

The author indicates the 2012 site investigation comprised the following scope and findings. The chemical analysis results are evaluated in Section 7.1.3. The investigation layout is shown in Figure 7.1.2 below and the borehole logs included as Appendix C.

- Drilling of seven window sampler boreholes (WS1 to WS7) to depths between 1.2m and 2.0m below ground level (bgl);
- Installation of ground gas and groundwater monitoring wells in four boreholes (WS1, WS3, WS4 and WS7);
- Laboratory analysis of soil samples by The Environmental Laboratory Limited (ELAB) for metals, pH and organic matter (9 samples), sulphate, cyanides, total phenol, ammonium, extractable petroleum hydrocarbons, speciated petroleum hydrocarbons and asbestos (3 samples), volatile organic compounds (2 samples) and speciated aromatic and aliphatic hydrocarbons, benzene, toluene, ethylbenzene and xylene (1 sample);

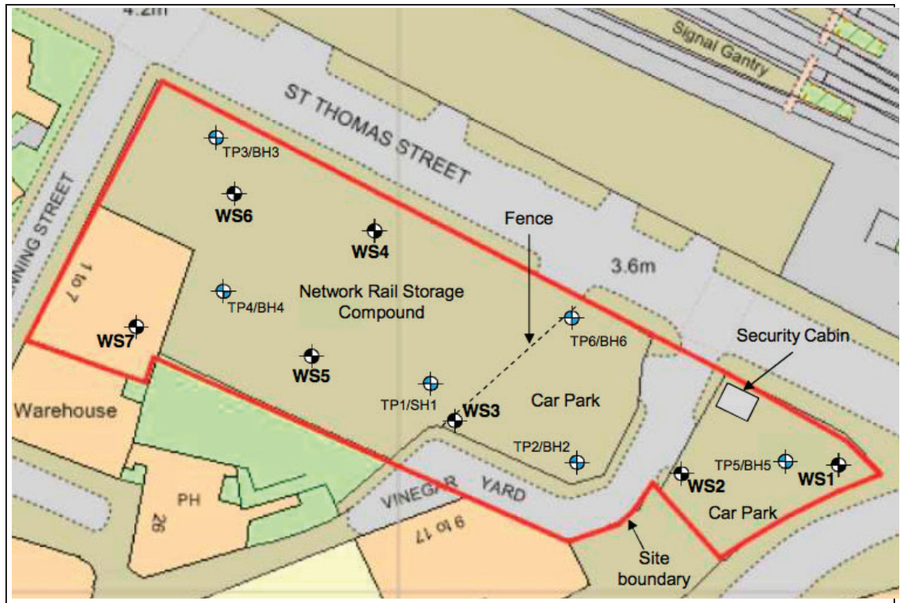

Figure 7.1.2: Ashdown Site Investigation Map Extract of Site Investigation Positions

- The author indicates that made ground was found to the maximum depth of the boreholes (2.0m) in six of the seven boreholes. Made ground was found to 1.2m bgl in WS2 located in the south-east of the site. Made ground is reported to comprise coarse gravel and silty clays with cobble sized brick, flint, concrete, coal, ash, clinker, quartz and glass;

- Alluvium was found between 1.2m and 2m in WS2 and comprised firm clay with carbonaceous matter, flint, shell fragments and calcareous nodules.

7.1.3 Site Investigation 1998

The author indicates the 1998 site investigation comprised the following scope. The investigation layout is shown in Figure 7.1.2 above and the borehole logs included as Appendix C:

- Excavation of six trial pits (TP1 to TP6) to depths between 1.1m and 3.1m;
- Follow on drilling through the six trial pits using cable percussion methods (BH1 to BH6) to 20m bgl;
- Laboratory analysis of nineteen samples for metal concentrations and 14 samples for petroleum hydrocarbons;
- The logs show made ground was 1.4m to 3.3m thick and comprised sand with brick, metal plastic, wood, concrete, sandstone, tile and flint;
- Concrete/ bitumen slab obstructions were found at five of the site trial pit locations (TP1 (1.5m &1.8m), TP2 (1.1m), TP3 (2.7m), TP5 (2.0m) and TP6 (1.5m)).
- The Made Ground is underlain by Alluvium (recorded to depths between 4.3 and 6.4m bgl), Kempton Park Gravel (recorded to depths between 8.9m and 10.05m bgl) and London Clay. The London Clay is present from approximately 10m below ground level (m bgl) to the full depth of the investigation (20m bgl).

7.1.4 Chemical Soil Conditions

- Ashdown completed a tier 1 assessment of the laboratory chemical data which is reported in their 2012 assessment and includes data collected from both the 1998 and the 2012 investigations. The chemical data is compared with Soil Screening Values (SSVs) for soil developed using CLEA inputs for a residential without private garden end use. Ashdown report that the following concentrations exceed the SSV and represent a risk to health if located in soft landscaping:
    - Lead (average concentration from 28 samples was 526 mg/kg and a 95% confidence limit of 874 mg/kg vs a screening value of 246 mg/kg); and
    - Benzo(a)pyrene (average concentration from 9 samples was 0.89 mg/kg and a 95% confidence limit of 2.41 mg/kg vs a screening value of 1.0 mg/kg).
- No detectable VOCs were found in two samples from the east of the site at the position of the former Timber Yard;
- The author reported that petroleum hydrocarbons were detected at concentrations up to 42.3 mg/kg and in the carbon range C21 to C35. The author also reports that no petroleum odours were detected from the soils;
- The author reports that cyanide, thiocyanate, sulphide, phenol and ammonium concentrations were ether low or below laboratory detection limits; and
- No asbestos containing materials were found in the three samples tested.

7.1.5 Ground Gas Monitoring

Ground gas monitoring has been undertaken during the 1998 and 2012 site investigations. The findings presented by Ashdown included:

- Ashdown (2012) indicate that three ground gas monitoring visits were undertaken in BH1, BH2, BH3 and BH4, two visits to BH5 and one visit to BH6 on 24 August and 8 and 21 September 1998. The borehole logs indicate that the monitoring standpipes were installed to 5m bgl, although the top of the response zone is not indicated;
    - Methane was measured at 4.3%, 0.4% and not detected in the three visits at BH4. Methane was not detected in the other five sampling points;
    - Carbon dioxide was measured at concentrations between 0.3 and 3.1%;

    - Depleted oxygen levels were measured in BH4 at concentrations between 1.4 and 6.2%. However, oxygen levels were >14% in the other five sampling points;
    - Atmospheric pressure was between 1010 and 1011 milibar (mb), 995 to 996 mb and 1027 mb during the three respective sampling visits; and
    - Gas pressure in the wells was generally zero with the exception of a measurement of -0.1 mb (BH1), -5.2 mb (BH2), -0.3 mb and 0.2 mb (BH4). Gas flow rates were not measured during the 1998 investigation.
- Ashdown (2012) indicate that three ground gas monitoring visits were undertaken in WS1, WS3, WS4 and WS7 on 12, 19 and 26 March 2012. The borehole logs indicate that the monitoring standpipes were installed in the made ground between 1.m and 2.0m bgl (except WS3, 0.4 to 1.2m bgl);
    - Methane and hydrogen sulphide was not detected in the four sampling points;
    - Carbon dioxide was measured at concentrations between 2.0 and 6.9% in WS4 and WS7, but was ≤ 0.1% in WS1 and WS3;
    - Oxygen levels were >14% in the sampling points;
    - Carbon monoxide was measured at 16ppm in WS3 (first visit), 2ppm in WS1 (2ppm), WS3 (2ppm) and WS4 (4ppm) in the third visit. The other measurements were zero;
    - Atmospheric pressure during the monitoring was between 1034 and 1036 mb. Gas pressure and emission rate was measured as zero in all three monitoring visits.
- Ashdown (2012) calculated gas screening values of 0.0069 for carbon dioxide and 0.0043 for methane which the author interpreted as Characteristic Situation 1. However, the author indicated this should be increased to Characteristic Situation 2 given that methane exceeded 1% (one monitoring visit BH1; 24 August 1998) and Carbon dioxide exceeded 5% (3 measurements from WS7 in 2012); and
- Standing groundwater levels in the boreholes during 2 visits in August and September 1998 were between 3.58m and 4.83m bgl.

7.1.6 Site Investigation Conclusions

Ashdown (2012) conclude that the following represent potential pollutant linkages at the site:

- Human dermal contact, inhalation and ingestion of soil dust containing lead and benzo(a)pyrene (low to moderate risk);
- Human inhalation of soil gases (low risk);
- Service and utilities in direct contact with made ground; and
- Phytotoxicity to plants.

Ashdown (2012) also indicate that there is not a significant pollutant linkage associated with controlled water and that risks to construction workers can be mitigated by good construction practices and personal protective equipment.

7.2 Evaluation of the Site Investigation Findings

It should be acknowledged that the author completed the comparison of the soil chemical data against soil guideline values suitable for a residential without garden end use, but where soft landscaping would be present. The Proposed Development is to remove the full thickness of made ground, Alluvium and Kempton Park Gravel by the construction of three levels of basement and is to largely comprise of hard landscaping (albeit the landscaping strategy is not yet confirmed). The assessment completed by the author is therefore conservative and it would be more appropriate to compare soil chemistry to commercial end use criteria.

The Suitable for use levels (S4UL) developed by LQM/CIEH for human health risk assessment for benzo(a)pyrene for a commercial end use is 35 mg/kg. The measured concentrations of benzo(a)pyrene (average 0.89 mg/kg and a 95% confidence limit of 2.41 mg/kg) in the soils were significantly below the S4ULs. A S4UL has not been developed for lead.

Category 4 Screening Levels have also been developed for lead and benzo(a)pyrene to support the Defra revised Part2A Statutory Guidance. The levels were developed by CL:AIRE 2014 and are presented in SP1010.

The C4SL for lead is 2,300 mg/kg and benzo(a)pyrene is 77 mg/kg for commercial use. The measured concentrations of lead (average 526 mg/kg and a 95% confidence limit of 874 mg/kg) and benzo(a)pyrene (average 0.89 mg/kg and a 95% confidence limit of 2.41 mg/kg) in the soils were significantly below these C4SLs.

The UK “natural background level” for lead in soil (defined by the Defra Research Project SP1008 as the 95th confidence limit on the 95th percentile concentration) is 820mg/kg in urban areas. The average concentration of lead 526 mg/kg is below the natural background level.

The basement level of the development is proposed to be excavated to -9.70m AOD (13.3m below the surrounding street level). The previous site investigations completed on the site have indicated that London Clay Formation is present from approximately 10m bgl and therefore the basement excavation will remove the made ground, Alluvium and Kempton Park Gravels from beneath the site. This excavation will result in the removal of soil sources that have potential to generate ground gases. Further protection from migration of ground gases from offsite will be provided by the basement waterproofing and ventilation of the internal spaces.

8. Conceptual Site Model and Environmental Risk Assessment

8.1 General

Current legislation relating to contaminated land in the UK is contained within Part 2A of the Environmental Protection Act (EPA) 1990, which was inserted by Section 57 of the Environment Act 1995, and by section 86 of the Water Act 2003, and elaborated within the Contaminated Land (England) Regulations 2006 [S.I 2006/1380] (amended 2012 [S.I. 2012/263]).

Land affected by contamination is also a material consideration under the Town and Country Planning Act 1990 and is aligned with the requirements under Part 2A of the EPA through the DCLG National Planning Policy Framework (NPPF) and associated online Planning Practice Guidance (PPG). Under the Planning regime, the Part 2A requirements are applied to the intended future use of the land so that following redevelopment, as a minimum, the site should be in such a condition that it cannot meet the definition of Contaminated Land.

The “suitable for use” approach is adopted for the assessment of contaminated land where remedial measures are only undertaken when unacceptable risks to human health or the environment are considered to be present taking into account the use (or proposed use) of the land in question together with the environmental setting.

Current best practice recommends that the determination of health hazard and hazards to the environment due to contaminated land is based on the principle of staged risk assessment, as outlined in Part 2A of the EPA 1990, the Contaminated Land Statutory Guidance and Environment Agency guidance document CLR11 ‘Model Procedures for the Management of Land Contamination’.

The risk assessment process for environmental contaminants is based on a source-pathway-receptor analysis. These terms can be defined as follows:

- **Source**: substance that has the potential to cause adverse impacts to human health, property or the environment.
- **Pathway**: route whereby the source may come into contact with the receptor: examples include ingestion of contaminated soil and leaching of contaminants from soil into watercourses.
- **Receptor**: target that may be affected by contamination: examples include human occupants/users of site, water resources (surface waters or groundwater), or structures.

For a risk to be present, there must be a viable contaminant linkage; i.e. a mechanism whereby a source impacts on a sensitive receptor via a pathway.

This section uses the information obtained in the previous sections (former/current on-site and off-site activities, regulatory records, understanding of ground conditions, site walkover observations and the proposed development) to develop and conceptual site model and identify potential sources of contamination on the site and in its surroundings, that could pose an unacceptable risk to the proposed mixed high-density residential/commercial development.

The magnitude of the risk associated with potential contamination at the site has been assessed using criteria based on those presented in Section 6.3 of the CIRIA Report “*Contaminated Land Risk Assessment: A Guide to Good Practice*” (CIRIA Report C552). These criteria require as assessment of the potential severity of risk and the likelihood of the risk occurring. A summary of the criteria is included as Appendix E.

8.2 Potential Sources of Contamination

The site has a long history of development, including a Timber Yard, Hop Warehouse, small scale businesses (including small scale tanning), warehousing and residential properties. However, the site investigations completed in 1998 and 2012, which included laboratory chemical analysis of soils and ground gas measurements, and the archaeological inspection trench excavations in 2018 have found Made Ground to a maximum depth of 3.3m that predominantly includes demolition type material and has not found evidence of contamination. Two small scale tanning barrels were exposed beneath the former Hop Warehouse slab in archaeological trench 3, but these were <1m diameter and will be excavated further for archaeological inspection purposes and will therefore be removed. These tanning barrels have not been operational since at least 1872.

The Hop Warehouse was constructed prior to 1872 and was present until the early 1980s when the building was demolished. A layer of yellow and brown sand with abundant bricks that has been used to infill the hop warehouse basement level and is across the site is likely to be the demolition material from the Hop Warehouse. Given the building was constructed prior to 1872, it is unlikely to have included asbestos in the building fabric. No evidence of fragmented asbestos containing materials has been observed in the previous site investigations or in the large scale archaeological inspection trenches.

The investigations completed in 1998, 2012 and 2018 therefore indicate that the Made Ground does not contain significant contamination and the Made Ground is predominantly demolition material (sand, brick and concrete) from historical phases of development.

The 2018 archaeological inspection trenches also indicate that the site use and a construction compound since the completion of the 2012 site investigation, has not impacted the soil conditions.

To conclude, this assessment has not identified potential contamination in the underlying ground and the Made Ground has been shown to represent demolition material (sand, brick and concrete).

8.3 Receptors and Pathways

8.3.1 Human health

The redevelopment of the site will include the construction of a three-storey water-tight ventilated basement that will remove the upper 13m of soil material beneath the full footprint of the site and the development is to largely comprise of hard landscaping. The site investigations have indicated that the London Clay is present from approximately 10m below ground level. The basement excavations indicated in the AKTII Ltd Basement Impact Assessment (December 2018) indicate the removal of the Made Ground, Alluvium and River Terrace Gravels and founding in the London Clay. Its construction will involve a secant piled wall to approximately 20m bgl followed by phases of excavation, dewatering and slab construction. There are therefore no viable exposure pathways between Made Ground, superficial geology, groundwater or ground gases and future site users and site neighbours. Adoption of best practices during construction will also protect neighbours from exposure to nuisance dust.

Based on CIRIA C552 criteria, the potential severity of risk to future site users is minor and the probability of the risk occurring is unlikely. This represent the lowest risk classification in the CIRIA criteria.

8.3.2 Site Neighbours

Although contaminated soils have not been identified, the contractor should perform the basement excavation works in a manner to protect site neighbours from exposure to nuisance dust emissions. Dust emissions can be controlled using standard good practices such as water suppression, covering soil stockpiles and construction plant wheel washing. Such measures should be included in the contractor's earthworks strategy and be planned with regard to '*The Control of Dust and Emissions During Construction and Demolition'* (published by the Greater London Authority; July 2014)

Based on CIRIA C552 criteria, the potential severity of risk to site neighbours is minor and the probability of the risk occurring is unlikely. This represent the lowest risk classification in the CIRIA criteria.

8.3.3 Construction Workers

The lack of significant contamination in the site soils indicates that good construction practices should be sufficient to manage the soil removal work during the basement construction and protect construction workers and neighbours during the works. The contractor will also be required to adopt a Discovery Strategy which will set out the actions that must be taken if contamination, which has not been previously identified, is encountered during the course of a development. Given that the previous 1998 and 2012 site investigations and archaeological trenching in 2018 has provided a comprehensive coverage of the site and has not encountered significant contamination, it is unlikely that site contamination, if found, would be anything more than an isolated hotspot.

Based on CIRIA C552 criteria, the potential severity of risk to construction workers is minor and the probability of the risk occurring is unlikely. This represent the lowest risk classification in the CIRIA criteria.

8.3.4 Groundwater

The basement excavation will remove the Made Ground, Alluvium and Kempton Park Gravel and the basement slab will be founded on the London Clay Formation. Regional groundwater quality in the shallow superficial aquifers is therefore unlikely to be impacted by the Proposed Development.

Some de-watering of the basement structure will be required during excavation. However, this will be restricted to a limited volume of groundwater within the basement structure, which will be cut-off from the surrounding shallow aquifer by the surrounding supporting basement walls. Groundwater quality in this heavily urbanised area of Southwark is also unlikely to have significant resource value and is not abstracted in the local area for use and therefore the sensitivity is reduced.

Deep piled foundations will be required for the tall buildings and these may penetrate through the full thickness of the London Clay (London Clay base found at 33m depth in a borehole located 50m east). However, the groundwater quality in the deeper aquifers below the London Clay is unlikely to be impacted given that the full thickness of the made ground, Alluvium and Kempton Park gravels to be removed and dewatered during the basement excavation.

Based on CIRIA C552 criteria, the potential severity of risk to groundwater quality is minor and the probability of the risk occurring is unlikely. This represent the lowest risk classification in the CIRIA criteria.

8.3.5 Surface Water

The removal of the made ground, Alluvium and River Terrace Gravels for the basement construction and the 380m distance to the nearest watercourse (The Thames) indicates the river water quality is unlikely to be impacted by the scheme.

An assessment of shallow groundwater quality is likely to be required to determine appropriate controls, licensing and disposal route for groundwater removed during dewatering.

Based on CIRIA C552 criteria, the potential severity of risk to surface water quality is medium and the probability of the risk occurring is low likelihood. This potential contaminant linkage is only viable should basement dewatering discharge the removed groundwater to a sewer. With appropriate dewatering controls the severity is reduced to minor and the risk to unlikely.

8.3.6 Sensitive Ecology

The regional area surrounding the site is heavily urbanised and no sites of ecological importance have been identified.

Based on CIRIA C552 criteria, the potential severity of risk to sensitive ecology is minor and the probability of the risk occurring is unlikely. This represent the lowest risk classification in the CIRIA criteria.

8.3.7 Plausible Contaminant Linkages

The inclusion of a deep basement beneath the full footprint of the development will remove made ground, Alluvium and Kempton Park Gravel and will key into the London Clay. Therefore, no plausible contaminant linkages have been identified that will impact site users, neighbours or environmental receptors post-development. Based on CIRIA C552 criteria, the potential severity of risk to future site users, neighbours, groundwater and ecological receptors is minor and the probability of the risk occurring is unlikely. This represent the lowest risk classification in the CIRIA criteria.

There is a potential that the chemical and physical parameters within groundwater removed during basement dewatering might be unsuitable for direct discharge to the storm-water sewer system. The contractor will need to investigate groundwater quality to determine the licensing and an appropriate discharge route for shallow groundwater removed during dewatering.

Although the soils have not been demonstrated to be contaminated, the contractor performing the basement excavation works will need to adopt industry good practices (i.e. '*The Control of Dust and Emissions During Construction and Demolition'* published by the Greater London Authority; July 2014) to appropriately manage the excavation of the basement so not to cause nuisance to site neighbours.

9. Land Quality Summary

Marshall Environmental Consulting Limited was commissioned by Trium Environmental Consulting LLP to undertake a Land Quality Risk Assessment to assess the land condition at the site to identify potential land quality risks and constraints that may be associated with the proposed redevelopment and to provide information to the Local Planning Authority as part of a pre-application information pack.

Current Site Description: The 0.3-hectare site is vacant with the exception of two warehouses located in the south west of the site.

Proposed Redevelopment: The Proposed Development will provide for a 19-storey building (plus ground and mezzanine levels) and 3-storey building (both with 3 basement levels) comprising a range of commercial floor space.

Site History: The site has a long history of development dating back to the 16th Century and has been through multiple phases of redevelopment. Identifiable site uses in the east of the site include a timber yard, leather warehouse, cardboard box factory and a printing ink and paper store. Centrally the site has been developed as a hop warehouse since 1872 until between the 1960s and 1980s. The west of the site has been developed as residential dwellings, leather, rubber and fruit and food packing warehouses, weighing machine repairs, garages and stables.

The site suffered bomb damage during WW2, However, the site layout shown in 1951 is similar to pre-war maps and suggests the damage was repairable. Given that the site was heavily developed and operational during WW2 it is unlikely that unexploded ordnance that may have struck the site would have gone un-noticed.

Since the 1980s the site was used for car parking and most recently as a contractor's storage yard during the redevelopment of the adjacent London Bridge Railway Station. The site is located in a heavily urbanised area and historical surrounding uses were predominantly residential and commercial. Immediately surrounding historical Industrial uses have included leather hide and bark factory, stationers, and hop warehouses.

Ground Conditions & Sensitivity: Ground investigations (including laboratory chemical analysis) undertaken in 1998 and 2012 and recent archaeological trenching in November 2018 showed the geological sequence to comprise Made Ground (maximum 3.3m of demolition material), Alluvium (base at 4.3m to 6.4m), Kempton Park Gravel (base at 8.9m to 10.95m) and London Clay Formation (proven to 20m bgl at the site and the base found at 33m bgl in a borehole located 50m east). Rest groundwater levels in 1998 were between 3.58 and 4.83m bgl and within the Alluvium. The investigation completed in 1998, 2012 and 2018 indicated that the made ground does not include contamination that represents a constraint to the Proposed Development. The made ground is predominantly demolition material (sand, brick and concrete) and no fragmented asbestos containing materials have been observed in the extensive archaeological trenches across the site.

The Alluvium and Kempton Park Gravels are a Secondary Aquifer and the London Clay Formation is an unproductive stratum. There are no potable groundwater abstraction wells within the vicinity of the site and it is not within a groundwater SPZ. The sensitivity and resource potential of shallow groundwater at the site is therefore reduced. The site and surrounding area is a well-established urban area of predominantly industrial and commercial uses. There are no identified areas of ecological importance or sensitivity within 250m.

A UXO Engineer's attended the site to monitor all machine excavations for archaeological purposes through non-natural ground. No suspicious metallic items were observed.

Environmental Risk: The provision of a deep basement comprising the full footprint of the Proposed Development will remove made ground, Alluvium and Kempton Park Gravel and the basement slab will be founded on the London Clay Formation. Therefore, no plausible contaminant linkages have been identified that will impact future site users, neighbours, controlled waters or environmental receptors post-development. Based on CIRIA C552 criteria, the potential severity of risk is minor and the probability of a risk to future site occupiers/visitors occurring is unlikely. This represents the lowest risk classification in the CIRIA criteria.

Recommendations: No further land quality assessments are considered necessary to evaluate land quality risks at the site given that comprehensive land quality investigations were completed in 1998 and 2012 and extensive visual assessment of archaeological trenches was undertaken in 2018. Mitigation measures are therefore not considered necessary for the completed operational aspect of the Proposed Development given the basement excavation will remove shallow soils to the London Clay Formation bedrock.

Although the soils have not been demonstrated to be contaminated, the contractor performing the basement excavation works will need to adopt industry good practices to appropriately manage the excavation of the basement during the period of construction so not to cause nuisance to site neighbours.

There is a potential that the chemical and physical parameters in groundwater removed during basement dewatering may be unsuitable for discharge to the storm-water sewer system. The contractor will therefore need to investigate groundwater quality to determine the licensing and an appropriate discharge route for groundwater removed during dewatering.

Introduction

The Environment Act 1995 has made site sensitivity a key issue, as the legislation pays as much attention to the pathways by which contamination could spread, and to the vulnerable targets of contamination, as it does the potential sources of contamination.
For this reason, Landmark's Site Sensitivity maps and Datasheet(s) place great emphasis on statutory data provided by the Environment Agency/Natural Resources Wales and the Scottish Environment Protection Agency; it also incorporates data from Natural England (and the Scottish and Welsh equivalents) and Local Authorities; and highlights hydrogeological features required by environmental and geotechnical consultants. It does not include any information concerning past uses of land. The datasheet is produced by querying the Landmark database to a distance defined by the client from a site boundary provided by the client.
In this datasheet the National Grid References (NGRs) are rounded to the nearest 10m in accordance with Landmark's agreements with a number of Data Suppliers.

LANDMARK INFORMATION GROUP®

London

Published 1875

Source map scale - 1:1,056

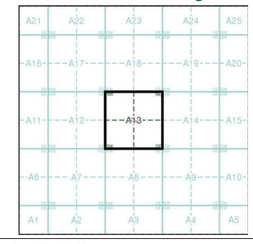

The 1:1056 scale of Ordnance Survey mapping was adopted from Ireland in 1848 and was used to survey towns with a population of over 4000, plus county towns of lesser population, in those counties mapped at the six-inch scale in 1841-55. The scale was the largest scale at which London was mapped by the Ordnance Survey and a 'skeleton' survey of the capital, showing little more than streets, street names, frontages and altitudes, was undertaken between 1848 and 1850. The majority of the 1:1056 surveys were later replaced by 1:500 surveys; although almost all the remainder were revised at this scale, sometimes more than once before 1895. The type of detail shown on the 1:1056 scale is broadly similar to that on 1:500; the apparent omission of minor details such as sewer access points and street lights may be as much a reflection of the generally earlier date of these plans, as of the specification of the map.

Please note: Due to the partial coverage of Historical Town Plans, it is possible that not all segments within an order will contain mapping. Only the segments that have Town Plan coverage will be generated.

LANDMARK INFORMATION GROUP®

London

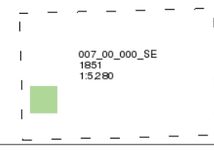

Published 1851

Source map scale - 1:5,280

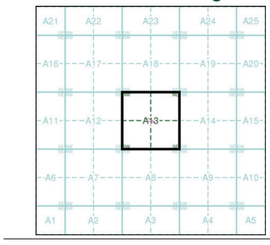

The historical town plans shown derive from Ordnance Survey mapping from the early to mid 1850s. The 1:2640 scale was introduced in the early 1850s, to survey districts covered by the Local Boards of Health and for a map of the Osborne Estate of Queen Victoria. The general style is similar to that of the early 1:2500s published shortly afterwards. 1:5280 scale was surveyed shortly afterwards in the mid 1850s as general purpose mapping with a standard of content similar to the more contemporary 1:10.560 mapping. The scale was also used for a reduction of the 1:1056 'skeleton survey' of London that was undertaken between 1848 and 1850.

Please note: Due to the partial coverage of Historical Town Plans, it is possible that not all segments within an order will contain mapping. Only the segments that have Town Plan coverage will be generated.

LANDMARK INFORMATION GROUP®

London

Published 1878

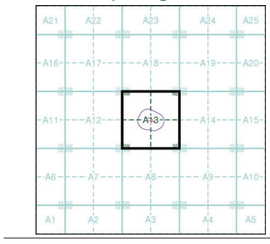

Source map scale - 1:2,500

The historical maps shown were reproduced from maps predominantly held at the scale adopted for England, Wales and Scotland in the 1840's. In 1854 the 1:2,500 scale was adopted for mapping urban areas and by 1896 it covered the whole of what were considered to be the cultivated parts of Great Britain. The published date given below is often some years later than the surveyed date. Before 1938, all OS maps were based on the Cassini Projection, with independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas.

London

Published 1916

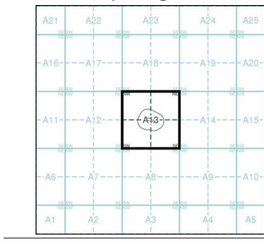

Source map scale - 1:2,500

The historical maps shown were reproduced from maps predominantly held at the scale adopted for England, Wales and Scotland in the 1840's. In 1854 the 1:2,500 scale was adopted for mapping urban areas and by 1896 it covered the whole of what were considered to be the cultivated parts of Great Britain. The published date given below is often some years later than the surveyed date. Before 1938, all OS maps were based on the Cassini Projection, with independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas.

Historical Aerial Photography

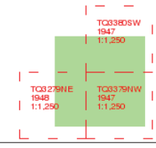

Published 1947 - 1948

Source map scale - 1:1,250

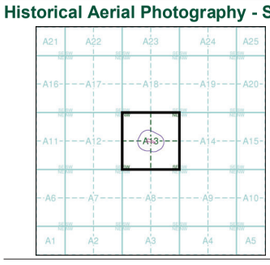

The Historical Aerial Photos were produced by the Ordnance Survey at a scale of 1:1,250 and 1:10,560 from Air Force photography. They were produced between 1944 and 1951 as an interim measure, pending preparation of conventional mapping, due to post war resource shortages. New security measures in the 1950's meant that every photograph was re-checked for potentially unsafe information with security sites replaced by fake fields or clouds. The original editions were withdrawn and only later made available after a period of fifty years although due to the accuracy of the editing, without viewing both revisions it is not easy to spot the edits. Where available Landmark have included both revisions.

Supply of Unpublished Survey Information

Published 1973 - 1976

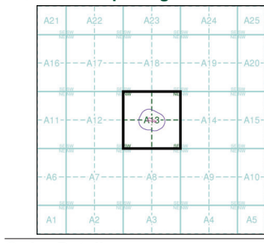

Source map scale - 1:1,250

SUSI maps (Supply of Unpublished Survey Information) were produced between 1972 and 1977, mainly for internal use at Ordnance Survey. These were more of a 'work-in-progress' plan as they showed updates of individual areas on a map. These maps were unpublished, and they do not represent a single moment in time. They were produced at both 1:2,500 and 1:1,250 scales.

Published 1880

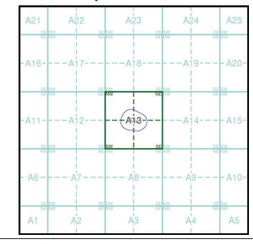

Source map scale - 1:10,560

The historical maps shown were reproduced from maps predominantly held at the scale adopted for England, Wales and Scotland in the 1840's. In 1854 the 1:2,500 scale was adopted for mapping urban areas; these maps were used to update the 1:10,560 maps. The published date given therefore is often some years later than the surveyed date. Before 1938, all OS maps were based on the Cassini Projection, with independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas. In the late 1940's, a Provisional Edition was produced, which updated the 1:10,560 mapping from a number of sources. The maps appear unfinished - with all military camps and other strategic sites removed. These maps were initially overprinted with the National Grid. In 1970, the first 1:10,000 maps were produced using the Transverse Mercator Projection. The revision process continued until recently, with new editions appearing every 10 years or so for urban areas.

Historical Aerial Photography

Published 1948 - 1949

Source map scale - 1:10,560

The Historical Aerial Photos were produced by the Ordnance Survey at a scale of 1:1,250 and 1:10,560 from Air Force photography. They were produced between 1944 and 1951 as an interim measure, pending preparation of conventional mapping, due to post war resource shortages. New security measures in the 1950's meant that every photograph was re-checked for potentially unsafe information with security sites replaced by fake fields or clouds. The original editions were withdrawn and only later made available after a period of fifty years although due to the accuracy of the editing, without viewing both revisions it is not easy to spot the edits. Where available Landmark have included both revisions.

10k Raster Mapping

Published 1999

Source map scale - 1:10,000

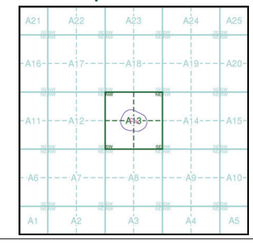

The historical maps shown were produced from the Ordnance Survey's 1:10,000 colour raster mapping. These maps are derived from Landplan which replaced the old 1:10,000 maps originally published in 1970. The data is highly detailed showing buildings, fences and field boundaries as well as all roads, tracks and paths. Road names are also included together with the relevant road number and classification. Boundary information depiction includes county, unitary authority, district, civil parish and constituency.

Ordnance Survey Plan

Published 1995

Source map scale - 1:10,000

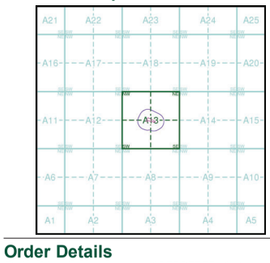

The historical maps shown were reproduced from maps predominantly held at the scale adopted for England, Wales and Scotland in the 1840's. In 1854 the 1:2,500 scale was adopted for mapping urban areas; these maps were used to update the 1:10,560 maps. The published date given therefore is often some years later than the surveyed date. Before 1938, all OS maps were based on the Cassini Projection, with independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas. In the late 1940's, a Provisional Edition was produced, which updated the 1:10,560 mapping from a number of sources. The maps appear unfinished - with all military camps and other strategic sites removed. These maps were initially overprinted with the National Grid. In 1970, the first 1:10,000 maps were produced using the Transverse Mercator Projection. The revision process continued until recently, with new editions appearing every 10 years or so for urban areas.

EXPLANATION OF SIGNS USED ON INSURANCE PLANS OF TOWNS & CITIES

CHAS. E. GOAD, LTD. CIVIL ENGINEERS — 56 CROUCH HILL LONDON N.4.

ABBREVIATIONS

ASB.	ASBESTOS
CORR	CORRUGATED IRON
D.I.D.	DOUBLE IRON DOORS
DRA.	DRAPERY
D.	DWELLING
ELECT.	ELECTRICIAN
(E.M.)	ELECTRIC MOTORS
(ENG.)	STEAM ENGINE
FURNR.	FURNITURE
GAR.	GARAGE
(G.E.)	GAS ENGINE
H.W.	HARDWARE
I.COLS.	IRON COLUMNS OR STEEL STANCHIONS
JWLY.	JEWELLERY
M.CL.	METAL CLAD
M.W.	MANCHESTER WAREHOUSE
m.l.	MATCH (OR WOOD) LINED
OIL	OIL & COLOR
(O.E.)	OIL ENGINE
P.H.	PUBLIC HOUSE
S.	SHOP
S.I.D.	SINGLE IRON DOORS
S.I.S.	SINGLE IRON SHUTTERS
TAI.	TAILORS
TENS.	TENEMENTS
W.G.	WIRED GLASS
W.N.	WIRE NETTING OVER GLASS

COLORS

- BRICK, STONE OR CONCRETE
- WOOD
- AREAS CLEARED DUE TO ENEMY ACTION
- SKYLIGHTS ON 1 & 2 STORY BUILDINGS
- SKYLIGHTS ON HIGHER BUILDINGS
- METAL BUILDINGS.
- TIMBER PILED OR STACKED

WALLS

- PARTY WALL 2 STORIES OR OVER, A PROBABLE FIRE CUT OFF
- ENTIRE WALL, BUT DOUBTFUL AS FIRE CUT OFF
- DEFECTIVE WALL — IMPERFECT
- WALL ABOVE IRON COLS: UNDER
- WALL SOME FLOORS ONLY (OR WOOD OR PLASTER PARTITION)
- ABOVE ROOF 6" TO 1'-6"
- —Dº— 1'-6" TO 2'-6"
- m.l. MATCH OR WOOD LINED
- WOOD CLAD WITH CORRUGATED IRON

OPENINGS

- PASSAGE UNDER
- ON ALL FLOORS
- SOME FLOORS ONLY — UNPROTECTED
- ALL FLOORS (PROTECTED)
- ALL FLOORS (SOME PROTECTED)
- SOME FLOORS ONLY (PROTECTED) — SINGLE IRON DOORS
- ALL FLOORS (SOME PROTECTED)
- ALL FLOORS (PROTECTED)
- SOME FLOORS ONLY (PROTECTED) — DOUBLE IRON DOORS
- WOOD LOADING DOOR
- IRON LOADING DOOR

WINDOWS

- ON ALL OR MOST FLOORS
- MORE THAN USUAL
- OVERLOOKING
- NEARLY ALL GLASS — UNPROTECTED
- OPENINGS THRO' 3 WINDOWS OVER
- ON SOME FLOORS ONLY
- PROTECTED BY WIRED GLASS
- PROTECTED BY SINGLE IRON SHUTTERS
- PROTECTED BY DOUBLE IRON SHUTTERS

WINDOWS IN FRONT & REAR OF BUILDINGS UNDERSTOOD UNLESS OTHERWISE SHOWN

FLOORS

1.2.3.3½ ETC. ON BUILDINGS ARE NUMBER OF STORIES ABOVE GROUND (3½=3 FLOORS & ATTIC)

2&2B MEANS 2 STORIES & 2 BASEMENTS BAST & SUB-BASEMENT.

SKYLIGHTS

- A LESS THAN 50 SQUARE FEET (SAY 10'x5', OR 7'x7')
- OPENINGS THROUGH 2 FLOORS UNDER (EACH STROKE DENOTES AN OPENING.)
- WITH WELL HOLE THROUGH 3 FLOORS
- LANT. LANTERN LIGHT: SIDES ONLY GLASS. — OVER 50 SQ: FT. TO SCALE
- OR VENT OR RAISED VENTILATOR

HOISTS & LIFTS

- H. OPEN
- H. OPEN (WOOD FLAP, DOORS)
- H. ENCLOSED WOOD OR PLASTER
- H. OPEN TO STREET
- H. ENCLOSED BRICK OR FIRE RESISTING WIRED GLASS DOORS

IRON DOORS SHOWN AS EXPLAINED UNDER "OPENINGS"

ROOFS

ASB	ASBESTOS
C	CONCRETE
CORR	CORRUGATED IRON
⅂	METAL
P	PATENT (FELT &c)
S	SLATE
T	TILE

PROFILES

WITH NORTH LIGHTS

SUNDRIES

- STEAM BOILERS
- —B— BOILER SET IN BRICK
- FACTORY CHIMNEYS
- (ENG.) STEAM ENGINE
- OVERHANGING WOOD CORNICE
- FIRE ALARM BOX
- —Dº— ON KEY PLAN
- HYDRANT
- H HYDRAULIC HYDRANT
- PRIVATE HYDRANT OR STAND PIPE
- D DOUBLE HYDRANT
- S SALT WATER HYDRANT
- SPRINKLER OR AUTO ALARM BELL

Appendix E CIRIA Risk Assessment Principles

Environmental Risk Assessment Principles

Using criteria based on those presented in Section 6.3 of the CIRIA Report "Contaminated Land Risk Assessment: A Guide to Good Practice" (CIRIA Report C552) the magnitude of the risk associated with potential contamination at the site has been assessed. To do this an estimate is made of:

- The potential severity of the risk; and
- The likelihood of risk occurring.

The severity of the risk is classified according to the criteria in Table E1.1 below.

Table E1.1: Severity of Risk

Severity	*Examples*
High	Acute risks to human health likely to result in "significant harm" (e.g. very high concentrations of contaminants/ground gases) Catastrophic damage to buildings/property (e.g. by explosion, sites with high gassing potential, extensive VOC contamination) Major pollution of controlled waters (e.g. surface watercourses or principal aquifers/source protection zones) Short term risk to a particular ecosystem
Medium	Chronic (long-term) risk to human health likely to result in "significant harm" (e.g. elevated concentration of contaminants/ground gases) Pollution of sensitive controlled waters (e.g. surface watercourses or principal/secondary A aquifers) Significant effects on sensitive ecosystems or species
Mild	Pollution of non-sensitive waters (e.g. smaller surface watercourses or Secondary B aquifers or unproductive strata) Significant damage to crops, buildings, structures or services (e.g. by explosion, sites with medium gassing potential, elevated concentrations of contaminants)
Minor	Non-permanent human health effects (requirement for protective equipment during site works to mitigate health effects) Damage to non-sensitive ecosystems or species Minor (easily repairable) damage to buildings, structures or services (e.g. by explosion, sites with low gassing potential)

The probability of the risk occurring is classified according to the criteria in Table E1.2.

Table E1.2: Probability of Risk

Probability	*Examples*
High likelihood	Pollutant linkage may be present that appears very likely in the short-term and risk is almost certain to occur in the long term, or there is evidence of harm to the receptor.

Likely	Pollutant linkage may be present, and it is probable that the risk will occur over the long term.
Low likelihood	Pollutant linkage may be present and there is a possibility of the risk occurring, although there is no certainty that it will do so.
Unlikely	Pollutant linkage may be present but the circumstances under which harm would occur even in the long-term are improbable.

An overall evaluation of the level of risk is gained from a comparison of the severity and probability, as shown in Table E1.3.

Table E1.3: Comparison of Probability and Severity

Probability		Severity			
		High	Medium	Mild	Minor
	High likelihood	**Very High Risk**	**High Risk**	**Moderate Risk**	**Moderate/Low Risk**
	Likely	**High Risk**	**Moderate Risk**	**Moderate/Low Risk**	**Low Risk**
	Low likelihood	**Moderate Risk**	**Moderate/Low Risk**	**Low Risk**	**Very Low Risk**
	Unlikely	**Moderate/Low Risk**	**Low Risk**	**Very Low Risk**	**Very Low Risk**

The requirements for further works or mitigation are dependent on the significance of the risk. Generally, 'Moderate' to 'Very High' risks are considered to be significant and in need of further assessment/mitigation, and 'Very Low' to 'Low' risks are generally considered insignificant and not requiring further assessment/mitigation. Professional judgement is often required in the determination of whether an effect is considered to be significant by taking account of whether effects are considered to be positive or negative, permanent or temporary, direct or indirect, the duration and frequency of the effect and whether any secondary effects are caused.
